

## **PREDINVESTICIONA STUDIJA**

**„FABRIKA ŠEĆERA BIJELJINA“ a.d. Velika Obarska –u stečaju**

Bijeljina, 19.03.2018.

Predinvesticciona studija "Fabrika šećera Bijeljina" AD

|

MVP BiH DMS, 06-05-5-6720/20, 20.03.2020  
Jasmin Gagula, 20.03.2020 15:25

PREDINVINVESTICIONA STUDIJA Šećerana Bijeljina - Ekonomski deo ; (31 - 172) - 16:05

Ova predinvesticiona studija je sačinjena na bazi Odluke odbora povjerilaca održane 08.02.2018.god u "Fabrika šećera Bijeljina" a.d. u stečaju kojom se želi dati predodžbu potencijalnim strateškim partnerima (kupcima) o mogućoj revitalizaciji fabrike, mogućnosti njenog budućeg rada i profitabilnosti proizvodnje šećera. Prema Odluci nosioci izrade su firma HAVREX d.o.o. Banja Luka, g-din Rade Rakić dipl. Tehnolog, g-din Slobodan Rakić, dipl. El.inžinjer i g-din Fafulić Meho dipl. Tehnolog

Predinvesticionu studiju je uradio ekspertska tim u periodu februar-mart 2018. koji su sačinjavali :

- Pavlović Zoran, dipl.ecc., HAVREX doo, - vodja tima
- Željko Bogdanić, dipl.ecc., HAVREX doo, Banja Luka
- Rakić Rade, dipl.ing.teh.
- Fafulić Mirko, dipl.ing.teh.
- Rakić Slobodan,dipl.el.ing.
- Nikolić Vojislav,dipl.el.ing.
- Faik Muhić, dipl.prav.

Napomena:

Deo tima, koji je uradio tehnički deo Predinvesticione studije u sastavu Rakić Rade, Fafulić Mirko, Rakić Slobodan i Nikolić Vojislav, ima puni autoritet i kreditibilitet, jer su isti bili rukovodioci u fabrici pre rata, ali i rukovodeći tim za izvodjenje remontnih radova i pripremu postrojenja u Fabrici šećera A.D. Bijeljina i obavljanje proizvodne u kampanji 2010 godine, kojom su uspeli da dobiju krajnji proizvod, odnosno šećer.

Izvršenim radovima, istovremeno su snimili i registrovali sve nedostatke za punu spremnost Fabrike šećera, da bi ista bila spremna da radi sa 100% projektovanog kapaciteta. Zato su pristupili izradi tehničkog dela ove Studije, kako bi se svi potencijalni kupci mogli upoznati sa potrebnim tehničkim i komercijalnim uslovima koje treba ispuniti u cilju obnavljanje proizvodnje u Fabrici šećera A.D. Bijeljina

## SADRŽAJ:

1.	Kratak istorijat „FABRIKA ŠEĆERA BIJELJINA“ a.d, u stečaju.....	4
1.1.	Opšte karakteristike fabrike	
2.	Prikaz sadašnje finansijske situacije fabrike.....	6
3.	Procjena tržišne pozicije fabrike.....	8
3.1.	Podaci o proizvodnji i potrošnji šećera u svijetu, Evropi i Bosni i Hercegovini	
3.2.	Proizvodnja šećera u okruženju	
3.3.	Plasman gotove proizvoda iz proizvodnje	
4.	Tehničko-tehnološko stanje i potrebna ulaganja po fazama i proizvodnim linijama.....	12
4.1.	Kapitalni remont, rekonstrukcije, sanacije objekata i nabavke	
4.2.	Rekonstrukcija, nabavka nove i polovne opreme, gradjevinska sanacija	
4.3.	Projektovana investiciona ulaganja	
4.4.	Dinamički plan procjenjenih potrebnih ulaganja sredstava za kapitalni remont	
5.	Ljudski resursi .....	15
5.1.	Menadžment	
5.2.	Radna snaga	
6.	Sirovinska baza .....	16
6.1.	Proizvodnja šećerne repe na području Semberije – istorija	
6.2.	Opsluživanje uzgoja	
6.3.	Kontrola kvaliteta uzgoja	
6.4.	Plan proizvodnje šećerne repe za kampanju 2019.	
6.5.	Planirana otkupna cijena šećerne repe	
7.	Rekapitulacije ukupnih ulaganja za pokretanje proizvodnje.....	19
8.	Plan prihoda od prodaje osnovnog proizvoda šećera i ostalih proizvoda.....	19
8.1.	Plan proizvodnje	
8.2.	Vrednost proizvodnje	
9.	Dinamičke projekcije prozvodnje i obezbjeđenja osnovnih sirovina i repromaterijala.....	20
10.	Dinamička projekcija proizvodnje šećera punim kapacitetom.....	20
11.	Proračun operativnih troškova i drugih poslovnih rashoda.....	21
11.1.	Materijalni troškovi sirovina i repromaterijala, radne snage i drugi poslovni rashodi	
11.2.	Obračun amortizacije	
12.	Finansijski efekti ulaganja-dinamička projekcija.....	22
13.	Dinamička tržišna-finansijska ocjena ulaganja.....	22
14.	Zaključak.....	25
15.	Anexi:	

1. Elektronska verzija svih podataka potrebnih za Kapitalni remont fabrike (raspoloživo po zahtjevu)

## **1. KRATAK ISTORIJAT „FABRIKE ŠEĆERA BIJELJINA“ AD**

Fabrika šećera Bijeljina izgrađena je i puštena u rad 1979. god. po konceptu firme „Polmex-checop“ iz Poljske. Projektovani kapacitet fabrike je 4000 t/dan prerade šećerne repe. Fabrika prvih godina proizvodnje nije mogla postići projektovani kapacitet, pa se pristupilo parcijalnom otklanjanju uskih grla u fabrici.

Rekonstrukcije su završene 1990. godine. Kampanja 1991. godine, po prvi puta je ostvarila rad projektovanim kapacitetom. Posle uspješne kampanje nastupio je rat na području Bosne i Hercegovine, ali ipak u ratu 1992. godine uspješno je održana kampanja.

Od 1993. god. do 2007. god. fabrika nije radila, ali su svi pogoni konzervisani i zaštićeni. Fabrika je prestala da radi i zatvorena bez dugova prema dobavljačima i poveriocima. U međuvremenu su radnici (koji nisu bili otpušteni) preuzeli obavezu čuvanja fabrike i bez isplate plata.

U toku stečajnog postupka 2009. god. fabriku je pokrenuo vlasnik, firma „Agrokop“ Export-import d.o.o Banja Luka, sa ciljem da se obnovi proizvodnja.

Na obnovi proizvodnje strateški partner je angažovao ključne rukovodioce i radnika fabrike šećera te više specijalizovanih građevinskih, mašinskih i elektro preduzeća na remontu opreme i objekata.

Planirani cilj strateškog partnera je bio da se fabrika pokrene i počne proizvodnja šećera i drugih nus proizvoda.

Kapaciteti šećerane su sa raspoloživim uloženim sredstvima u remontu osposobljena i puštena u rad 2010. godine. U probnoj kampanji, proizvodnji, prerađena je manja količina šećerne repe (oko 20.000 tona) i dobiven je šećer. Na taj način je ostvaren cilj strateškog partnera.

Kako bi se fabrika pokrenula u punom kapacitetu, u januaru 2011. godine stručni tim fabrike je pristupio izradi planova za kapitalni remont:

- planova za rekonstrukcije i prvi stepen modernizacije u oblasti elektro-energetskih postrojenja - automatizacije tehničkog procesa,
- ugradnju nove opreme na filtraciji i pumpama za transport sokova i šećerovina,
- modernizaciju procesne i prijemne laboratorije te
- nabavku neophodne mehanizacije u odjeljenju unutrašnjeg transporta.

Sve ekspertske analize su pokazale da da se za navedene poslove kapitalnog remonta mora planirati ulaganje od oko 20.060.336 KM (Poglavlje br.7. Rekapitulacija ukupnog ulaganja).

Radi nemogućnosti izmirenja poreskih obaveza Poreska uprava Republike Srbije je 16.12.2015. godine je pokrenula drugi stečaj nad Fabrikom šećera, koji je i dalje u toku. U toku stečajnog postupka, sudija je povjeriocima priznao potraživanja, te je Fabrika šećera Bijeljina danas sa stečajnim upravnikom, skupštinom i odborom povjerilaca, ali drugih BEZ DUGOVANJA i sa aktivnim računom u poslovnoj banci, ali i dalje u postupku stečaja.

Kapaciteti fabrike su u solidnom stanju, sa očuvanom proizvodnom cijelinom, konzerviranim postrojenjima i proizvodnom cijelinom, sa raspoloživim ljudskim resursima – ključnim ekspertskim timom, ranijim rukovodiocima, te sa dovoljno radnika i raspoloživih poljoprivrednih površina u krugu od 100 kilometara oko same fabrike dovoljnih za pokretanje proizvodnje u kratkom roku.

Predinvesticiona studija „Fabrika šećera Bijeljina“ AD

### **1.1. Opšte karakteristike fabrike**

Fabrika šećera – Bijeljina izgrađena je 1979. godine. Projektovani kapacitet prerade je 4.000 tona šećerne repe na dan. Planirana godišnja prerada u kampanji je 400.000 tona slatkog korjena. Fabrika je izvršila rekonstrukciju 1990. i 1991. god. i fabrika je proizvodila oko 55.000 tona šećera u kampanji, što je maksimalni postignuti kapacitet.

Fabrika se prostire na cca 50 hektara, koji su u vlasništvu fabrike. Ekološka obrada korištene vode se obavlja u lagunama, taložnicima. Na površini od cca 30 hektara izgrađena je upravna zgrada, glavna proizvodna hala sa svim pratećim objektima i pripadajućim magacinima kao i deponijama za repro materijal i sirovinu.

Fabrika se snabdева kompletном svežom vodom iz sopstvenih bunara – 3 bunara sa po 300m<sup>3</sup>. Na preostalih 20 ha izgradene su lagune za prihvatanje svih otpadnih voda sa sistemom za prečišćavanje, tako da ispunjava ekološke kriterije.

Posjeduje svoju energiju od 96 MW koja ima

- dva kotla po 50 tona na ugalj iz lokalnog rudnika,
- dva kotla po 4,5 tona/ na mazut,
- turbinu i generator od 8 MW.

Fabrika iz elektro mreže koristi električnu energiju samo dok ne startuje sopstvenu proizvodnju, a nakon toga višak proizvedene električne energije, na bazi ugovora sa Elektrodistribucijom je u mogućnosti vraćati i prodavati u distributivnu mrežu.

Preradom šećerne repe projektovanim kapacitetom od 4.000 t/dan proizvedi se:

- cca 550 do 560 tona/dan šećera,
- 250 t/dan briketiranog rezanca i
- 170 t/dan melase.

Za skladištenje proizvedenog šećera instalisani su kapaciteti od dva betonska silosa čiji je ukupni kapacitet 40.000 tona. Pakovanje šećera se vrši u pogonu opremljenom :

- dvije polu-automatske mašine za pakovanje šećera u ventil vreće od 50 kg, i
- automatskom mašinom tipa Heeser za pakovanje šećera po jedan i dva kilograma.

Takođe, posjeduje i liniju za proizvodnju šećera u kocki koji je tradicionalni proizvod u BiH. Kapacitet linije za proizvodnju šećera u kocki je 23 t/dan. Površina prihvavnog magacina šećera za cca 2.000 m<sup>2</sup> sa kapacitetom skladištenja od 8.000 t upakovanih proizvoda u magacinima.

Skladište melase ima kapacitet od 14.000 tona. Skladište za prihvatanje briketiranog rezanca je površine od 3000 m<sup>2</sup>, sa kapacitetom prerade od 20.000 t upakovanih briketa. U svom krugu ima benzinsku pumpu i magacin za maziva i ostale hemikalije. Takođe, posjeduje i magacin rezervnih dijelova čija je korisna površina od cca 500 m<sup>2</sup>.

Prihvativne deponije i skladišta u fabrici su:

- za svježu repu kapaciteta od cca 15.000 tona,
- uglja .....20.000 tona,
- kamena krečnjaka..... 10.000 tona
- koksa .....2.000 tona
- skladište mazuta .....cca 3.500 tona.

Glavna upravna zgrada ima površinu od 400 m<sup>2</sup> kancelarijskog prostora, restoran od 500 m<sup>2</sup> priručnu ambulantu od 40 m<sup>2</sup>. Svi navedeni objekti se moraju renovirati.

Fabrika posjeduje i prateće objekte:

- mašinsku radionicu sa opremom za održavanje i izradu rezervnih dijelova za kompletno održavanje u sopstvenoj režiji mašinsko-tehnološke opreme,
- elektro radionicu i
- mehaničku radionicu za održavanje sopstvene građevinsko-poljoprivredne mehanizacije.

Sopstvena laboratorija fabrike u mogućnosti je da sa svojim radnicima vrši kontrolu svih ulaznih sirovina i hemikalija kao i sve faze proizvodnje u tehnološkom procesu te gotove proizvode.

Fabrika šećera osim prerade šećerne repe može da vrši i

- rafinaciju sirovog trščanog šećera ( uz manju rekonstrukciju za koju postoje projekti ) u kapacitetu od cca 450 t/dan bijelog kristalnog šećera, van perioda kampanje.

Za svoju proizvodnju, fabrika do 1992. god. zapošljavala oko 450 radnika a u sezoni prerade šećerne repe još oko 500 sezonskih radnika.

Na bazi iskustava iz proizvodnje, u toku kampanje rada punim kapacitetom fabrika preradi: 400.000 t repe i proizvede: - 55 do 56.000 tona šećera

- 17.000 tona melase
- 25.000 tona briketiranog rezanca a za to potroši:

- 40.000 tona uglja,
- 20.000 kamena krečnjaka,
- 2.000 tona koksa,
- 1,200.000 natron vreća od 50 kg,
- 40 t maziva,
- oko 10.000 mazuta.

U toku kampanje fabrika angažuje više od 200 autoprevoznika sa njihovim kamionima, koji su raspoloživi lokalno u periodu od 100 dana rada, koliko traje kampanja prerade šećerne repe.

Fabrika šećera u toku proizvodnje ima dodatne proizvode- melasu i rezanac, koji su lako utrživi na tržištu.

Prema statističkim podacima BiH godišnje potroši cca 150.000 tona šećera. Posebno se mora naglasiti da je proizvedeni šećer u fabrici šećera domaći proizvod koji je proizведен iz šećerne repe proizvedene na njivama Semberije i Posavine.

U BiH, poslije rata, podignuta je rafinerija za doradu sirovog trščanog šećera u Brčkom.

Analizama potrebe tržišta u okruženju na oko 400-800 km od Bijeljine, nedostaje cca 1,5 milion tona šećera (Mađarska, Rumunija, Italija,Bugarska,Makedonija,Crna Gora,Slovenija.....).

Trenutno cijena šećera na evropskom tržištu se kreće između 450 i 550 evra po toni, što daje osnov svakom ozbiljnog investotoru za isplatu povjerilaca i preuzimanje fabrike te pokretanje proizvodnje.

## 2. Prikaz sadašnje finansijske situacije „Fabrike šećera Bijeljina“

Pošto se Fabrika nalazi u postupku stečaja, potencijalni strateški partner/kupac može postati većinski vlasnik (67,98%) na način da isplati potraživanja stečajnih povjerilaca koja ukupno iznose 16.262 hiljade KM.

VLASNIČKA STRUKTURA (prije proglašenja stečaja)

	Vlasnici	Iznos u KM	% vlasništva

Više detalja se može naći u finansijskim izvještajima koji su prikazani na web stranici Banjalučke berze, budući da je Fabrika šećera kao akcionarsko društvo u obavezi da iste objavljuje na taj način, a i sve imovinske transakcije se odvijaju preko Berze (link:

<https://www.blberza.com/Pages/issuerannouncements.aspx?&code=FSBN-R-A> ).

### 3. Procjena tržišne pozicije

#### 3.1. Podaci o proizvodnji i potrošnji šećera u svijetu, Evropi i Bosni i Hercegovini

Prema izvještaju svjetske organizacije za hranu FAO, koja djeluje u okviru UN, najveći proizvođači šećera u svijetu i Evropi su:

\*10 najvećih proizvođača šećera u svijetu

	ZEMLJA	Proizvodnja u milionima tona
1	Brazil	24,8
2	Indija	22,1
3	Kina	11,1
4	SAD	8,0
5	Tajland	7,3
6	Australija	5,4
7	Meksiko	4,9
8	Francuska	4,4
9	Nemačka	4,2
10	Pakistan	4

\* Najveći

	ZEMLJA	Proizvodnja u milionima tona
1	Francuska	4,4
2	Nemačka	4,2
3	Poljska	2,0
4	Velika Britanija	1,2
5	Španija	1,2
6	Danska	0,9

proizvođači šećera u Evropi

Predinvesticiona studija "Fabrika šećera Bijeljina" AD

Ukupna proizvodnja šećera u svijetu iznosi oko 175 miliona tona, od čega je cca 80 % šećer proizведен iz šećerne trske, a 20 % iz šećerne repe.

Prosječna potrošnja šećera u svijetu iznosi 21,4 kg po glavi stanovnika. U razvijenim zemljama svaki stanovnik u prosjeku godišnje potroši 35 – 40 kg šećera, dok se u nerazvijenim zemljama potrošnja šećera svodi na 5-10 kg po glavi stanovnika. Danas u svijetu je sve veća potrošnja raznih zasladića, među kojim je šećer zastupljen sa 80 %.

Na osnovu detaljnih analiza stanja tržišta, FAO procjenjuje da će se do 2020. god. sa sadašnjih 175 miliona tona proizvodnja šećera povećati za 30 miliona tona. Ovakve procjene su zasnovane na osnovu trenda porasta broja stanovnika, rasta ekonomije i industrije mnogoljudnih zemalja. Na osnovu statističkih podataka u Evropi se proizvodi oko 10 % svjetske proizvodnje šećera.

Prema poznatim činjenicama vrlo je vjerovatno da će proizvođači iz EU povećavati proizvodnju i plasman na svjetsko tržište, jer Brazil je ograničen resursima te nema mogućnosti za povećanje proizvodnje, dok Indija, koja je drugi proizvođač u svijetu, ima prilično zastarjelu tehnologiju i oronule fabrike.

FAO prognozira da će u svijetu 2030. godine proizvodnja porasti na cca 257 miliona tona, a do 2050.g. na 300-350 miliona tona šećera.

U bližem okruženju proizvodnja šećera je sledeća:

### 3.2. Proizvodnja šećera u okruženju

	ZEMLJA	Proiz. u milionima tona	Napomena
1	Srbija	0,55	<b>Rade fabrike:</b> Pećinci, Kovačica, Vrbas, Senta, Žabalj, Crvenka <b>Ugašene fabrike:</b> Beograd, Kovin, Požarevac, Čuprija, Peć, Bač, Zrenjanin, Šabac, Nova Crnja, S. Mitrovica
2	Hrvatska	0,35	<b>Rade fabrike:</b> Virovitica, Osjek, Županja <b>Ugašene fabrike:</b> Beli Manastir
3	BiH	0,13	<b>Rade fabrike:</b> Brčko (uvozi sirovi šećer iz trske i vrši doradu-rafinaciju) Bijeljina je potencijalno u radnom stanju, ali ne radi i jedina je proizvođačka fabrika šećera u BiH
4	Slovenija	-	<b>Ugašena fabrika:</b> Ormož
5	Makedonija	-	<b>Ugašena fabrika:</b> Bitola
6	Crna Gora	-	Nema proizvodnju šećera

U BiH je, poslije rata, podignuta rafinerija za doradu sirovog trščanog šećera u Brčkom i pokrenuta proizvodnja 2010. g. u Fabrići šećera Bijeljina.

Prema podacima institucija koje prate tržište šećera u svijetu i Evropi, u posljednje tri godine zabilježen je trend rasta cijene šećera tako da uz manje varijacije cijena šećera na svjetskim tržištima dostiže nivo od 330 dolara po toni, dok na evropskom tržištu drži nivo između 450 i 550 evra po toni.

Analizom tržišta, na teritoriji Bosne i Hercegovine, plasman gotovih proizvoda bi trebao biti zagarantovan u potpunosti, jer proizvodnja uz puni kapacitet fabrike (do 60.000 tona šećera) predstavlja cca 30 % ukupnih potreba Bosne i Hercegovine.

Prema statističkim podacima BiH godišnje potroši oko 160.000 tona šećera. Posebno se mora naglasiti da bi proizvedeni šećer u „Fabrići šećera Bijeljina“ bio domaći proizvod koji je proizведен iz šećerne repe proizvedene na njivama Semberije i Posavine.

Melasa se u potpunosti takođe može plasirati na tržištu BiH, a po konkurentnim cijenama (koje nadmašuju cijenu koštanja) u potpunosti se može izvesti u države u okruženju.

Silirani ili suvi odslađeni rezanac se u potpunosti može izvesti ili u cijelosti plasirati na domaće tržište.

### **3.3. Plasman gotovih proizvoda iz proizvodnje**

#### **Proizvodnja šećerne repe**

Područje Semberije posjeduje više od 38.000 ha obradive zemlje koja je odgovarajuća za proizvodnju šećerne repe, što je osnovni uslov da se sa sigurnošću može očekivati samo u Semberiji sjetvu na površini od min. 4.000 ha.

Uz dobru organizaciju i dobar poslovni odnos sa proizvođačima repe te dobrim i kvalitetnim radom na terenu moguće je obaviti kvalitetno sjetvu na sledećim površinama:

1. 3.000-6.000 ha na području Semberije
2. 1.000-2.000 ha na području Posavine
3. 2.000 ha na području Mačve i Srema, što je dovoljno za planirani kapacitet fabrike.

Fabrika je dosada imala slijedeći asortiman gotovih proizvoda:

- šećer kristal bijeli pakovanja 1; 2 i 50 kg
- sušeni i briketirani rezanac pakovanja po 40 kg
- melasa (isporka auto-cisternama)

Obzirom na činjenicu da je dosadašnji asortiman ponude osnovnog gotovog proizvoda bio vrlo skroman, to se u svrhu povećanja konkurenčke sposobnosti na tržištu nameće potreba njegovog proširenja na sitna i ukrasna pakovanja:

- na maloprodajna pakovanja od 5-10 i 25 kg šećera,
- tzv. „džambo vreće“ od 1.000 kg,
- ugostiteljska pakovanja od 5-10 grama.

Napomenimo i da postoji tržišni prostor za plasman tečnih šećera, te bi u okviru rekonstrukcije trebalo predvidjeti i osposobljavanje linije za proizvodnju tečnih šećera.

Fabrika šećera u toku proizvodnje ima nus proizvode melasu i rezanac, koji su u svijetu veoma cijenjeni kao sirovina iz koji se proizvode cijenjeni proizvodi, koji na tržištu dostižu višestruku prodajnu cijenu u odnosu na cijenu koštanja.

Predinvesticiona studija "Fabrika šećera Bijeljina" AD

### **3.4. Korištenje nus proizvoda i rafinacija trščanog šećera**

Kao dodatna aktivnost fabrike u periodima izmedju dve kampanje je mogućnost proizvodnje šećera iz sirovog trščanog šećera. Za navedeno je potrebno investiranje. Obezbeđivanje potrebnih količina sirovog kao alternativne sirovine u dijelu proizvodnje ne predstavlja problem obzirom na količine raspoložive na tržištu (uvoz) i postojeće nabavne cijene.

Mogućnosti za povećanje prihoda fabrike bi bio u proizvodnji alkohola. Dodatnim investiranjem u opremu koja bi se postavila u postojeću halu za prerada melase u alkohol i stočni kvasac dobili bi se značajni prihodi.

Kalkulacija pokazuje da se iz 1 tone melase dobija 500-550 litara 96% alkohola koji je tržišno veoma interesantana proizvod. Sadašnja cijena alkohola na tržištu BiH je cca 2,50 KM/l.

Fabrika šećera kao dodatni, nus proizvod ima islađeni rezanac koji se oduvijek mogao prodavati koristio kao stočna hrana. Predlažemo da se rezanac suši, ako je cijena energenta (npr. mazuta) prihvatljiva. Alternativno, ukoliko je cijena energenta nepovoljna, može se vršiti siliranje rezanaca u krugu fabrike. Silaža bi se plasirala kao stočna hrana na području Semberije. Fabrika ima mogućnost da proizvede veoma kvalitetnu silažu, sa veoma niskom cijenom proizvodnje.

Kao treći nus proizvod veoma je interesantan saturacioni mulj, koji bi se doradio, te bi se dobilo saturaciono đubrivo, koje je jako korisno za kalcifikaciju zemljišta na teritoriji Semberije i Posavine čija su zemljišta pretežno kisela. Saturaciono đubrivo izuzetno je korisno dodavati na oranice, voćnjake, baštę. Saturaciono đubrivo povećava prinos na kiselim zemljištima i do 40 %, zavisno od kulture koja se gaji.

Fabrika je u mogućnosti proizvesti do 30.000 tona saturacionog đubriva. Napominjemo da saturaciono đubrivo povećava biološko-fizičke osobine zemljišta. Takođe, ubrzava sušenje zemljišta posle velikih padavina, a kontrolisano zadržava vlagu u sušnom periodu.

Prihod od saturacionog đubriva bi se mogao ostvariti do 4,000.000 KM. Na području Semberije na više od 70 % zemljišta godišnje bi trebalo po ha baciti 3-4 tone. Iz navedenoga se može zaključiti da u narednih 10 godina bi plasman bio zagarantovan.

Posebno bi se saturaciono đubrivo moglo koristiti kao dodatni stimulans proizvođačima šećerne repe, što bi se prilikom ugovaranja detaljno definisali uslovi preuzimanja.

Uvođenje novih proizvoda i proširenje assortimana dosadašnje proizvodnje, fabrika bi radila cca 300 dana preradu (u jednom vidu produžene kampanje), angažovana radna snaga bi bila ravnomjernje iskorištena tokom cijele godine, a fabrika bi po tom osnovu ostvarivala dodati bruto prihod na godišnjem nivou od oko 30,000.000 KM (prema okvirnim proračunima).

Opšti zaključak je da za kompletну proizvodnju fabrike postoji dovoljno tržišnog prostora, tj. plasman je u potpunosti obezbjeđen na tržištu BiH i Evrope.

#### **4. Tehničko-tehnološko stanje i potrebna ulaganja po fazama i proizvodnim linijama**

##### **4.1. Kapitalni remont , rekonstrukcije, sanacije objekata i nabavke**

Ova Pred-investiciona studija obuhvata listu neophodnih radovi na

- proizvodnoj opremi, radovi
- na sanaciji cijevne mreže,
- građevinski radovi na objektima,
- modernizacija proizvodnje,
- sanacija restorana,
- nabavka nove i polovne opreme u proizvodnji,
- nabavka nove opreme za laboratoriju,
- nabavka polovne mehanizacije za potrebe opsluživanja proizvodnje,
- djelimična antikorozivna zaštita,
- nabavka kancelarijskog namještaja i birotehničke opreme.

Remont mogu obavljati radnici Proizvodno-tehničkog sektora, koji su ranije bili zaposleni u fabriči, uz angažovanje trećih lica na specifičnim poslovima Elektroenergetike, Mjernoregulacione tehnike, Automatike, Termoenergetike i građevinskim radovima (sanacija krovova, fasada, cevarenju i dr.).

Za proizvodnju koja se ostvarila u kampanji 2010 godine izvršene su aktivnosti na interventnoj sanaciji na proizvodnim kapacitetima sa ciljem pokretanja proizvodnje. Tokom tih aktivnosti koje su realizovane u fabriči sagledano je:

- stanje tehnološkog procesa
- stanje elektro-energetskih postojenja
- stanje ispravnosti merno-regulacione tehnike (koja se mora inovirati)
- stanje automatike (koja se mora inovirati i/ili u potpunosti zamjeniti)
- stanje termoenergetike
- gradjevinsko stanje objekata fabrike neophodno za kapitalni remont, koji je projektovan i sastavni deo Studije.

Na bazi realizovane proizvodnje, kapitalni remont se mora obaviti na sledećim tehnološkim cjelinama:

1. Linija prijema i skladištenja šećerne repe
2. Linija pranja i transporta repe
3. Linija rezanja i proizvodnje sirovog soka
4. Linija sušenja i briketiranja rezanaca
5. Linija čišćenja i proizvodnja rijetkog soka
6. Linija proizvodnje gustog soka
7. Rafinerija
8. Proizvodnja kreča,  $\text{Ca}(\text{OH})_2$  i  $\text{CO}_2$ -gasa
9. Energana i hemijska priprema vode
10. Linija vodosnabdjevanja i sistema za prečišćavanje otpadnih voda
11. Prijemna i procesna laboratorija
12. Elektro-energetika i Mjerno-regulaciona tehnika
13. Linija skladištenja, pakovanja šećera
14. Radna jedinica transporta i mehanizacije
15. Restoran za ishranu radnika

Predinvesticiona studija "Fabrika šećera Bijeljina" AD

#### **4.2. Rekonstrukcija, nabavka nove i polovne opreme, građevinska sanacija**

Planom je predviđena zamjena devastirane i nefunkcionalne opreme u proizvodnji nabavkom nove ili adekvatno polovne koja će u potpunosti tehnički biti u funkciji.

Za pokretanje proizvodnje mora se obnoviti sledeća oprema i to:

1. Nabavka 6 novih centrifugalnih pumpi za transport sirovog i rijetkog soka.
2. Nabavka dvije nove automatske prese umjesto vakum filtera.
3. Nabavka jednog novog DDS filter-uguščivača na I-filtraciji
4. Nabavka 6 zupčastih pumpi na rafineriji
5. Nabavka jedne nove ili polovne elektronapojne pumpe za energanu
6. Rekonstrukcija na liniji vakuma
7. Rekonstrukcija MRT i Automatike (Projekat urađen 2011. godine)
8. Rekonstrukcija - prilagodavanje za preradu trščanog šećera (projekat urađen 1997. god.)
9. Rekonstrukcija PP mreže,
10. Nabavka nove laboratorijske opreme
11. Nabavka nove i polovne poljoprivredne i građevinske mehanizacije, kao i voz nog parka
12. Nabavka opreme za restoran kapaciteta 400 obroka
13. Nabavka kancelarijskog namještaja
14. Nabavka birotehničke opreme
15. Sanacija krovova - fasada na objektima
16. Sanacija cjevne podzemne mreže

Kroz taj proces pripreme i probne proizvodnje u fabrići su sačinjeni su zapisnici i evidentirane potrebe po svim segmentima proizvodnog procesa, te sačinjeni okvirni predmeri i predračuni za kapitalni remont čije kompletne podatke dajemo u nastavku teksta.

#### **4.3. Projektovana investiciona ulaganja**

Sredstva za kapitalni remont, rekonstrukcije, modernizaciju, građevinske radove, nabavku opreme procenjuju se u ovoj Studiji na sledeći način:

##### **REKAPITULACIJA TROŠKOVA**

1. LINIJA PRIJEMA, SKLADIŠTENJA, TRANSPORTA I PRANJA REPE .....	86.900 KM
2. REZANJE, EKSTRAKCIJA, SUŠENJE I BRIKETIRANJE REZANACA .....	158.900 KM
3. LINIJA ZA PROIZVODNJU KREČA I CO2 GASA .....	98.800 KM
4. LINIJA ČIŠĆENJA I FILTRACIJE .....	2,351.600 KM
5. LINIJA OTPARAVANJE I PROIZVODNJU GUSTOG SOKA .....	67.000 KM
6. RAFINERIJA .....	142.000 KM
7. LINIJA SUŠENJA , SKLADIŠTENJA I PAKOVANJA ŠEĆERA .....	85.900 KM
8. VODOSNABDJEVANJE I SISTEM ZA PREČIŠĆAVANJE OTPADNIH VODA .....	1,286.000 KM
9. LINIJA SUŠENJA I BRIKETIRANJA REZANACA .....	5.000 KM
10. PRIJEMNA I PROCESNA LABORATORIJA .....	350.000 KM
11. ENERGANA .....	1,500.000 KM
12. REMONT EL-ENERGETIKE, MJERNOREGULACIONE TEHNIKE I AUTOMATIKE .....	6,000.000 KM
13. REKONSTRUKCIJA FABRIKE ZA PRERADU SIROVOG TRŠČANOG ŠEĆERA .....	400.000 KM
14. NABAVKA ALATA ZA TEHNIČKI SEKTOR .....	80.000 KM
15. ANTIKOROZIONA ZAŠTITA .....	700.000 KM
16. UREĐENJE KRUGA I SANACIJA OGRADE OKO FABRIKE .....	60.000 KM

17. SANACIJA FASADA I KROVOVA OBJEKATA .....	800.000 KM
18. NABAVKA MEHANIZACIJE .....	.850.000 KM
19. SANACIJA RESTORANA .....	80.000 KM
20. SANACIJA UPRAVNE ZGRADE- KANCELARIJE.....	60.000 KM
<b>UKUPNO KM :</b>	<b>15,162.100 KM</b>

#### 4.4 Dinamički plan procijenjenih potrebnih ulaganja sredstava za kapitalni remont

Datum	IZNOS u KM	PLANIRANI RADOVI
Faza I T+ 7 dana	2,000.000	<ul style="list-style-type: none"> <li>• Izrada detaljnih planova, projekata, tendera</li> <li>• Sanacija restorana i nabavka opreme</li> <li>• Nabavka alata</li> <li>• Nabavka mehanizacije</li> <li>• Nabavka potrošnog materijala</li> <li>• Nabavka kancelarijskog namještaja</li> <li>• Početak remonta mašinsko-tehnološke opreme</li> <li>• Uvođenje trećih firmi na remontu</li> <li>• Otvaranje gradilišta</li> <li>• Nabavka el. kablova i ugradnja</li> <li>• Početak</li> <li>• Početak remonta na energetici i MRT</li> <li>• Nabavka rezervnih djelova po prioritetu</li> <li>• Početak sanacije krovova i fasada</li> <li>• Početak radova na sanaciji cjevne mreže</li> <li>• Betonska sanacija bazena i zaštita</li> <li>• Početak radova na AKZ</li> <li>• Početak čišćenja taložnih polja</li> <li>• Isplata avansa, faktura i situacija za izvršene nabavke i radove</li> </ul>

\*NAPOMENA:

1. Da bi se kvalitetno uradio kapitalni remont prema navedenom planu , kupac/investitor mora obezbjediti 15,162.100 KM, a prema predloženom termin planu .
2. Da bi se fabrika kvalitetno pripremila za preradu šećerne repe u 2019. potrebno je uraditi sledeće:
  - Da investitor formira odmah po preuzimanju fabrike rukovodnu strukturu u fabrići.
  - Primiti prvu grupu radnika najkasnije do 15.08.2018.god. , čiji bi zadatok bio da se sa investitorom obezbjede uslovi za otvaranje gradilišta ( izrada planova i tehničke dokumentacije, ospozobljavanje priručnih radionica, obezbjeđenje HTZ -opreme, obezbjeđenje ručnog i specijalnog alata, nabavka mehanizacije, formiranje

Predinvesticijona studija "Fabrika šećera Bijeljina" AD

- radničkog restorana, uređenje kruga fabrike, formiranje obezbeđenja fabrike, izraditi normativna akta za neophodno pravno-ekonomsko poslovanje i sl.)
- Da se najkasnije do 25.08.2018.god. usvoje planovi za remont i termin planovi prijema radne snage, kao i termin plan uvođenja posebnih specijalizovanih firmi na poslovima remonta.

**\*\*NAPOMENA:**

Elektronska verzija svih podataka potrebnih za Kapitalni remont fabrike je raspoloživa potencijalnim kupcima.

## **5. Ljudski resursi**

### **5.1 Menadžment Fabrike šećera Bijeljina a.d.**

Ključni dugogodišnji rukovodioci fabrike šećera su i danas raspoloživi za angažovanje i saradnju te za pokretanje proizvodnje u fabrici. U tom timu danas su na raspolaganju sledeći bivši rukovodioci i to:

1. Rakić Rade, dipl.ing.teh. – tehnički i komercijalni menadžer
2. Fafulić Mirko, dipl.ing.teh. – tehnički i komercijalni menadžer
3. Rakić Slobodan,dipl.el.ing.- procesni menadžer , Zrenjanin
4. Nikolić Vojislav,dipl.el.ing - vlasnik firme Energo Sistem, Brčko - elektro sektor
5. Faik Muhić, dipl.pravnik – vlasnik pravničke firme Muhić, Tuzla – pravna služba

Navdeni tim eksperata je sačinio ovu Predinvesticionu studiju i za sve gore navedene rukovodioce biografije su raspoložive za potencijalnog kupca.

### **5.2 Radna snaga**

Kada je fabrika bila u pogonu i proizvodnji, prije rata zapošljavala 450 stalnih radnika i oko 500 sezonskih radnika.

U slučaju planirane modernizacije djelova fabrike projektovano je da u fabrici bude zaposleno 200 stalnih i 200 sezonskih radnika.

Za novo primljene radnike treba predvideti program obuke za rad i korištenje instalirane opreme, a za to se mogu angažovati gore navedeni menadžerski tim.

## **6. Sirovinska baza**

### **6.1. Proizvodnju šećerne repe na području Semberije - istorija**

Fabrika šećera je radila od 1979 godine a prestala da radi 1993. god. radi ratnih dešavanja u Bosni i Hercegovini.

Ponovnim pokretanjem fabrike 2010. godine rukovodstvo fabrike, PD „Semberija“, PZ „Agroseemberija“, jedan broj zadruga i individualni proizvođači počeli su raditi na oživljavanju proizvodnje šećerne repe na ovim područjima. Obzirom da je ponovo fabrika zaustavljena prestale su aktivnosti na omasovljenju proizvodnje.

Semberija koja se prostire između dvije velike rijeke Sava i Drina je idealna oblast za proizvodnju šećerne repe, obzirom da voda učestvuje 75 % u prinosu. Voda za potrebe navodnjavanja obradivih površina nalazi se u dovoljnoj količini već na dubini oko 5 m.

Predinvesticiona studija "Fabrika šećera Bijeljina" AD

Šemberija posjeduje 38.000 ha zemljišta koje je pogodno za proizvodnju šećerne repe, što omogućuje proizvodnju za rad fabrike projektovanog kapaciteta uz poštovanje četverogodišnjeg plodoreda.

Šemberiju zahvata umjerena kontinentalna klima. Najviše padavina je u maju i junu, a najmanje u martu i septembru. Snijeg se zadržava do 40 dana (decembar-mart). Zime su blage sa prosečnom temp. od -2 °C. Relativna vlažnost iznosi 70-80%. Broj sunčanih dana kreće se od 75-100 dana. Temperatura u junu, julu, avgustu i septembru kreće se od 15-37°C. Srednja godišnja temperatura je 10°C.

Semberska zemlja je dobrog kvaliteta, pretežno je rasprostranjena plodna crnica, černozem, ritska crnica i rječni nanosi. Veće obradive površine su povoljne za uzgoj šećerne repe.

Na području semberije i posavine sjetva se obavlja u periodu od 25. 03. do 20. 04. na pripremljenim parcelama. Priprema parcele za sjetvu podrazumjeva oranje strnjika, duboko oranje, tanjirjanje i rasturanje đubriva NPK 8-16-24 u količini od 200 kg/Ha. Pred sjetvu vrši se đubrenje sa NPK 15-15-15 u količini od 400 kg/ha i KAN, AN u količini od 200 kg/ha. Proizvođači korišćenog đubriva su: Pančevo, Subotica (Srbija) i Kutina (Hrvatska).

Ako se pravilno izvrši jesenja priprema i grubo ravnjanje parcele, predsjetvena obrada zemljištva i kvalitetna zaštita (od cerkospore, buvača, pipe, lisna vaš) prinos mora biti dobar. Uz kvalitetnu pripremu prinos u semberiji iznosio je oko 45 do 55 T/Ha.

Zaštitna sredstva (insektidi, herbicidi) korišteni su iz programa BASF – Njemačka. U praksi se navedena đubriva se daju kao avans. U toku sjetve avansno se daje i sredstvo za prskanje protiv korova. Besplatno su davana sredstva za ostala prskanja, jer domaći proizvodjači nemaju dovoljne kreditne sposobnosti, a na ovaj način se ostvaruje bolja saradnja.

Većinom se koristilo KWS sjeme nove generacije. Planskom proizvodnjom pre 1993. godine vršeno je sejanje sa planskim plodoredom svake četvrte godine na istoj parcelli. Potrebna količina sjemena je oko 1,2 SJ/ha. Sejanje se obavlja putem pneumatskih sijačica.

## 6.2. Opsluživanje uzgoja šećerne repe

Pošto na teritoriji Republike Srpske domaćinstva raspolažu sa manjim parcelama (prosjek 2 ha) broj uzbajivača pre rata kretao se od 3000 do 4500 sa prosječnom površinom od 0,8 ha. Danas dobar dio individualnih proizvođača posjeduju parcele i preko 10 ha.

Ugovaranje repe vršila je fabrika direktno sa proizvođačima, veoma malo preko zadruga. Kompletну proizvodnju šećerne repe avansno je pokrivala fabrika uz besplatno davanje sredstava za prskanje protiv cerkospore, buvača i pipe. U cilju unapredjenja proizvodnje proizvođačima šećerne repe fabrika je ustupala besplatno oko 15 % sirovog rezanca na predanu repu.

Fabrika šećera je oslonjena samo na drumski transport, što znatno poskupljuje proizvodnju. Potrebno je nastaviti aktivnosti oko obezbjeđenja željezničkog transporta do fabrike. Što se tiče mehanizacije za proizvodnju šećerne repe (sijačice, kombajni za vađenje i dr. polj. mehanizacija) fabrika nema. Veći dio je u ratu otuđen ili devastiran. Potrebna je nabavka nove mehanizacije.

Da bi se obezbjedio dobar prinos, a to će se sigurno rješiti navodnjavanjem, potrebno je nabaviti sisteme za navodnjavanje. Trenutno u Semberiji je mali broj domaćinstava koji posjeduje opremu za navodnjavanje.

Trenutno, na području Republike Srpske cijene drugih poljoprivrednih kultura su bilansno ne povoljnije za proizvodnju u odnosu na šećernu repu. Danas samo proizvodnja povrće ima prednost u odnosu na repu. Prednost u proizvodnji repe u odnosu na povrće je siguran otkup kompletne proizvodnje i garancija poštovanja ugovorene cijene.

#### **6.3. Kontrola kvaliteta uzgoja šećerne repe**

Utvrđivanje kvaliteta šećerne repe vrši se u fabričkoj laboratoriji. Kvalitet šećerne repe ( sadržaj šećera i % nečistoća ) određuje se u sirovinskoj laboratoriji uzimajući najmanje jedan uzorak iz svakog vozila.

#### **MIŠLJENJE:**

Budući investitor/vlasnik ima dobru perspektivu da na području Semberije i Posavine obezbjedi dovoljne količine repe za pun kapacitet fabrike.

Takođe, obzirom da su fabrike šećera u Šapcu i Sremskoj Mitrovici ugašene, to daje šansu Bijeljinskoj šećerani da taj prostor pokrije za proizvodnju i otkup repe sa navedenog područja. Posebno je interesantno područje Mačve, jer je udaljenost od Fabrike šećera do njiva 60 km.

#### **6.4. Plan proizvodnje šećerne repe za kampanju 2019.**

Za kampanju u 2019. godini može se planirati proizvodnja od cca. 300.000 tona šećerne repe na području Semberije i Posavine, Srema i Mačve.

Područje Semberije posjeduje više od 38.000 ha obradive zemlje koja je odgovarajuća za proizvodnju šećerne repe, što je osnovni uslov da sa sigurnošću može očekivati da samo u Semberiji 2019.god. sjetvu na površini od min. 4.000 ha.

Uz dobru organizaciju, dobar poslovni odnos sa proizvođačima repe, dobrim i kvalitetnim radom na terenu moguće je obaviti kvalitetno sjetvu na sledećim površinama:

	u 2019 god.	u 2020.god.
	Ha	Ha
Semberija	3000	4000 - 6000
Posavina	1000	1500 - 2000
Srem-Mačva	2000	2000

Da bi se sa sigurnošću, kod proizvođača, stvorili zainteresovanost za sijanje ove industrijske kulture na području Semberije i Posavine, strateški partner/vlasnika fabrike mora se posebno angažovati na terenu, a potrebna je i podrška Vlade Republike Srpske.

- Uz dobru organizaciju, te disciplinovani rad na terenu i kvalitetan podsticaj mišljenje je da je moguće ostvariti sjetvu na cca 6000 Ha, što bi omogućilo jednu kvalitetnu proizvodnju u 2019.god.

Predinvesticiona studija "Fabrika šećera Bijeljina" AD

- Da bi ostvarili planirane količine repe potrebno je obezbjediti do kraja septembra 2018. Ugovore u kojima će biti jasno definisane obaveze fabrike šećera i proizvođača šećerne repe.
  - Zbog značaja proizvodnja šećerne repe i rada fabrike, predlažemo da šećerna repa treba biti tretirana od strane Vlade kao strateški proizvod, jer je to značajan kapacitet koji može doprineti povećanju bruto društvenog proizvoda Republike Srpske.
  - U skladu sa kalendarom za proizvodnju šećerne repe blagovremeno obezbjedi sav repro materijal, kompletan stručni nadzor od pripreme zemljišta, sjetve do vađenja i predaje u fabriku. Takođe je važno radi stvaranja povjerenja između poljoprivrednika i fabrike, da se poštuje ugovorenio vrijeme isplate za isporučenu šećernu repu.
  - Preporuka:
    - Da se traži od Vlade Republike Srpske, odnosno Ministarstva za poljoprivredu da uvrstiti u plan posticaja za proizvodnju šećerne repe, u cilju stimulisanja poljoprivrednih proizvodjača za sjetvu 2019. godine. Smatra se da posticaj mora biti vezan za kg predate repe, a ne po površini zasejanom navedenom kulturom.
- Naš predlog: Posticaj da bude 0,02 KM/kg predane čiste repe fabrici šećera u Bijeljini.

#### **6.5. Planiranje otkupne cijene šećerne repe**

Za proizvodnju šećerne repe u 2019. godini, ovom predinvesticionom studijom kalkulacije su sačinjene prema sledećim uslovima:

1. Otkupna cijena šećerne repe iznosila bi 70 KM/t čiste repe, a na bazi digestije od 16 %.
2. Za veću ili manju digestiju cijena se preračunava na bazi sledeće tabele:

Digestija %	do 12,99	13,00	13,50	14,00	14,50	15,00	15,50	16,00	16,50	17,00	17,50	18,00
Cijena KM/t	54,69	56,88	58,80	61,25	63,43	65,62	67,81	70,00	72,19	74,38	78,56	78,75

3. Avansno obezbjediti sjeme šećerne repe (1,2 SJ/ha)
4. Avansno obezbjediti sredstvo za zaštitu od cerkospore
5. Avansno obezbjediti sredstvo za zaštitu od repine pipe
6. Stimulacija u obliku djubriva/sirovog rezanaca od 10 % na predanu količinu čiste repu
7. Avansno obezbjediti osnovno mineralno đubrivo NPK 15:15:15 u količini od 600 kg/ha
8. Avansno obezbjediti mineralno đubrivo KAN u količini od 400 kg/ha
9. Treba tražiti od Vlade RS da se odobri subvencija proizvodjačima na dizel od 40 l /ha
10. Treba tražiti od Vlade RS podsticaj proizvodjačima šećerne repe u cilju podrške fabrici.

Predlaže se da se konačni obračun uradi u roku od 5 dana po predaji šećerne repe, a u skladu sa Ugovorom. Plaćanje po obračunu obaviti najkasnije u roku od 30 dana.

Da bi uspjeo plan proizvodnje potrebno je hitno pristupiti izradi plana za nabavku potrebnih repro-materijala, te početi sve aktivnosti na terenu. Neophodno je odmah, po potpisu Ugovora sa proizvođačem, isporučiti sav repro-materijal (sjeme, đubrivo, zaštitu .....) .

Pripremu zemljišta, sjetvu i nadzor u toku proizvodnje, vađenja i predaje u krug fabrike trebaju vršiti rejonski instruktori i služba fabrike zadužena za proizvodnju Šećerne repe.

### **NAPOMENA:**

- Očekivani-planirani prinos je minimalno 45 t/ha.
  - U 2019. godini planirati da se ugovori proizvodnja šećernu repu na području Mačve i Srema na površini od oko 2.000 ha.
  - Proizvodnju repe planirati u prečniku do 100 km udaljenosti od fabrike

#### **7. Rekapitulacija ukupnih ulaganja za pokretanje proizvodnje**

Category	Sub-Category	Item	Description	Quantity	Unit	Price	Total
Clothing	Apparel	Shirt	Men's long-sleeved button-down shirt	1	PC	\$50.00	\$50.00
Clothing	Apparel	Pants	Men's dress pants	1	PC	\$75.00	\$75.00
Clothing	Footwear	Shoes	Men's leather dress shoes	1	PC	\$120.00	\$120.00

Na bazi svih prethodno pomenutih elemenata predinvesticione studije, može se smatrati da je za pokretanje proizvodnje, procenjena ostala i nepredvidiva ulaganja, te obrtnih sredstava koja su potrebna za početak rada i na organizovanju proizvodnje šećerne repe kod poljoprivrednih proizvodjača procenjujemo da je neophodno obezbijediti iznos od **20.060.336 KM**

#### **8. Plan prihoda od prodaje osnovnog proizvoda šećera i ostalih proizvoda**

## 8.1 Plan proizvodne

U kampanji 2019. godini se ovom studijom planira prerada od minimum 300.000 t šećerne repe. Preradom 300.000 t šećerne repe moguće je proizvesti:

1. Šefer iz repe	(13 %)	39.000 t
2. Melasa	(4,5 %)	13.500 t
3. Suvog rezanac	(6,3 %)	18.900 t

### 8.2. Vrijednost proizvodnje

Vrijednost proizvodnje (realizacija)		2019.	2020.	2021.	2022.	(cijene)
1. Šećer iz repe	35.100.000	46.051.200	49.982.400	49.982.400	900	KM/t
2. Šećer iz trske	-	-	-	-	-	KM/t
3. Melasa	4.050.000	5.313.600	5.767.200	5.767.200	300	KM/t
4. Sivi rezanac	6.615.000	8.678.880	9.419.760	9.419.760	350	KM/t
<b>TOTAL</b>	<b>55.755.000</b>	<b>60.042.680</b>	<b>65.160.360</b>	<b>65.160.360</b>		

Napomena: \* Cijene su formirane na bazi trenutno važećih na tržištu BiH.

## 9. Dinamičke projekcije prozvodnje šećerne repe i obezbjeđenja osnovnih sirovina i repromaterijala

Plan proizvodnje šećerne repe	2019		2020		2021		2022		...

## 13. Dinamička tržišno-finansijska ocjena ulaganja

Da bi se izradila korektna i realna dinamička finansijska ocjena ovako projektovanog ulaganja (posmatranog kao investiciju) uvedena je hipotetska pretpostavka da će se predmetno ulaganje finansirati dugoročnim komercijalnim kreditom (što je inače praksa kod ovakvih investicija), po uslovima koji su prikazani:

Kredit		iznos u KM
iznos:	20.060.336	god.k-ta u gresu 1.203.620
grace period:	1 godina	
rok otplate:	10 godina	godišnji anuitet 2.949.315 KM
kamatna stopa god.:	6%	

Na definisanje vremenskog horizonta posmatranja investicije presudan uticaj ima činjenica da gro ulaganja čine ulaganja u opremu, njen prepostavljeni vijek trajanja, odnosno moralnog i funkcionalnog rabaćenja. U skladu sa navedenim je rok otplate potencijalnog kredita za finansiranje ovakve investicije, te sve zajedno definiše ekonomski vijek projekta (investicije ili ulaganja) te su sve dinamičke projekcije urađene prema njemu.

Vremenski horizont (ekonomski vijek Projekta): 10 godina

Finansijska ocjena investicije prevashodno podrazumijeva procjenu likvidnosti. Likvidnost ovako koncipiranog projekta jeste njegova sposobnost da u svakom razdoblju svog vijeka podmiruje sve dospjele finansijske obaveze. Neto primici u finansijskom toku predstavljaju povećanje finansijskog potencijala (uz uslov da su pozitivne veličine).

Likvidnost ovog projekta se procjenjuje kao veoma povoljna, budući da su neto primici u svim godinama vijeka projekta pozitivni ili drugim riječima rečeno finansijska ocjena ovako koncipiranog projekta je "izrazito likvidan projekat".

<b>10 NETO PRIMICI (3-9)</b>	<b>-13.811</b>	<b>9.373</b>	<b>10.643</b>	<b>10.643</b>	<b>11.233</b>	<b>11.233</b>	<b>11.233</b>	<b>11.233</b>	<b>36.847</b>

Ekonomski tok projekta pokazuje ekonomske dobiti i ekonomske žrtve u životnom vijeku projekta, bez obzira na način na koji je finansiran i na temelju ekonomskog toka se ocjenjuje rentabilnost projekta i pomoću toga se mjeri direktni doprinos predmetnog ulaganja.

Pošto su vrijednosti neto primitaka ekonomskog toka prikazane dinamički u budućnosti, to je potrebno vrijednosti budućih neto primitaka svesti na vrijednost iz godine kada se vrši ulaganje, a pomenuto svođenje vrijednosti se vrši putem diskontne stope. Diskontna stopa se određuje kao prosječna ponderisana kamatna stopa koju izjednačavamo sa cijenom izvora finansiranja ili u ovom slučaju diskontnu stopu determiniramo kao realnu pozitivnu kamatnu stopu za komercijalni kredit iz kojeg bi se moglo finansirati kompletno ulaganje, a koja na domaćem finansijskom tržištu u prosjeku iznosi:

Diskontna stopa: **6,00%**

Predinvesticiona studija "Fabrika šećera Bijeljina" AD

Prema metodi perioda povrata investicionog ulaganja, ukupno uložena sredstva se u potpunosti vraćaju u trećoj godini vijeka projekta, odnosno za 2,3 godine, što je i logično imajući u vidu visoku likvidnost i akumulativnost predmetnog ulaganja.

**Period povrata ulaganja (u 000 KM)**

godina u vijeku projekta	Ukupno ulaganja		Iznos akumulacije		nepokriveni dio ulaganja
	godiš- nje	kumu- lativno	godiš- nje	kumu- lativno	
2019	0	20.060	20.060	6.249	6.249 -13.811
2020	1	0	20.060	9.373	15.622 -4.438
2021	2	0	20.060	10.643	26.266 6.205

Neto sadašnja vrijednost (NPV) pokazuje koliki je neto efekat projekta sveden na sadašnju vrijednost. Vrijednosti neto primitaka iz ekonomskog toka su svedene na sadašnju vrijednost primjenom diskontne stope od 6%. Diskontovanjem se dobija neto sadašnja vrijednost u iznosu od 70.736.000 KM. Obzirom da je NPV pozitivna to znači je po ovom kriteriju projekat prihvatljiv i izvodljiv. To takođe znači da se ovaj projekta isplati finansirati dugoročnim kreditom uz kamatnu stopu koja je jednaka diskontnoj stopi (6%) uz izuzetno visoku rentabilnost ovako koncipiranog ulaganja.

Neto sadašnja vrijednost (NPV) (u 000 KM)	2019.	2020.	2021.	2022.	2023.	2025.	2026.	2027.	2028.
NETO PRIMICI iz ekonomskog toka	13.811	9.373	10.643	10.643	11.233	11.233	11.233	11.233	36.847
<hr/>									
<hr/>									
diskontna stopa 6,00%									
<hr/>									
Neto sadašnja vrijednost NPV 70.736									

Primjenom metode interne stope rentabilnosti ( IRR ) utvrđuje se diskontna stopa koja sadašnju vrijednost neto primitaka ekonomskog toka projekta izjednačava sa nulom. IRR ovog projekta je izrazito visoka i iznosi 77,50 %, kao posljedica visoke likvidnosti i profitabilnosti ovako koncipiranog projekta.

Interna stopa rentabilnosti predstavlja maksimalno prihvatljivu kamatnu stopu po kojoj bi se mogao finansirati ovaj projekat ( ako je cijeli finansiran iz kredita ).

Takođe IRR predstavlja i stopu prinosa koju donosi kapital uložen u ovako koncipiran projekat ( ili se može interpretirati kao iprosječno godišnje ukamačivanje investicionog ulaganja).

Budući da je IRR daleko iznad prosječne kamatne stope na kredite to je i po ovom kriterijumu ocjene ovaj projekat preporučeno prihvatljiv i izvediv.

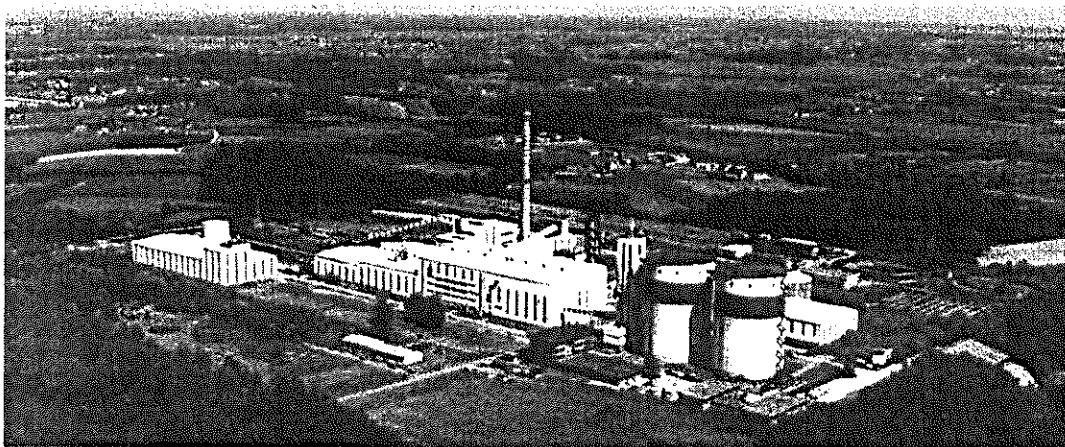

[Neto sadašnja vrijednost (u 000 KM)]

#### 14. Zaključak:

- Fabrika šećera Bijeljina izgrađena je i puštena u rad 1979. god. po konceptu firme „Polmex-checop“ iz Poljske. Projektovani kapacitet fabrike je 4000 t/dan prerađe šećerne repe. Kampanja 1991. i 1992. godine, je ostvarila rad projektovanim kapacitetom proizvodnje od 55.000 tona šećera. Posle uspješne kampanje nastupio je rat na području Bosne i Hercegovine, ali ipak u ratu 1992. godine uspješno je održana kampanja. Od 1993. god. do 2007. god. fabrika nije radila, ali su sví pogoni konzervisani i zaštićeni. Probna proizvodnja je bila u kampanji 2010.godine.
- Radi nemogućnosti izmirenja poreskih obaveza Poreska uprava Republike Srpske je 16.12.2015. godine je pokrenula drugi stečaj nad Fabrikom šećera, koji je i dalje u toku. U toku stečajnog postupka, sudija je povjeriocima priznao potraživanja, te je **Fabrika šećera Bijeljina danas sa stečajnim upravnikom, skupštinom i odborom povjerilaca, ali drugih BEZ DUGOVANJA i sa aktivnim računom u poslovnoj banci, ali i dalje u postupku stečaja.**
- **Potencijalni strateški partner otkupom svih priznatih potraživanja od povjerilaca u visini od 16.261.961,53 KM, odnosno plaćanjem odredjene svote potraživanja povjeriocima stečajnog dužnika, postaje 100% vlasnik stečajnog dužnika- Fabrike šećera Bijeljina, te u pravnom smislu postaje „pravni sljednik“ svih prava fabrike šećera a bez bilo kakvih daljih dodatnih obaveza.**
- Da bi se fabrika pokrenula u punom kapacitetu, stručni tim fabrike je izradio planove za kapitalni remont koji su raspoloživi i obuhvataju:
  - planovi za rekonstrukciju u oblasti elektro-energetskih postrojenja-automatizacije tehnološkog procesa,
  - potpuna modernizacija upravljanja proizvodnjom putem računarskih sistema
  - ugradnju nove opreme na filtraciji i pumpama za transport sokova i šećerovina,
  - modernizaciju procesne i prijemne laboratorije te
  - nabavku neophodne mehanizacije u odjeljenju unutrašnjeg transporta.
- Sve ekspertske analize su pokazale da da se za navedene poslove kapitalnog remonta mora planirati ulaganje od oko **20.060.336 KM**, koji se prema Studiji i metodi perioda povrata investicionog ulaganja, ukupno uložena sredstva se u potpunosti vraćaju u trećoj godini vijeka projekta, odnosno za 2,3 godine.
- Likvidnost ovog projekta se procjenjuje kao veoma povoljna, budući da su neto primici u svim godinama vijeka projekta pozitivni ili drugim riječima rečeno finansijska ocjena ovako koncipiranog projekta je **„izrazito likvidan projekat“**.
- Budući da je IRR daleko iznad prosječne kamatne stope na kredite to je i po ovom kriterijumu ocjene ovaj projekat preporučeno prihvativ i izvediv.

Predinvesticiona studija "Fabrika šećera Bijeljina" AD

**PRE-INVESTMENT STUDY**  
**"SUGAR FACTORY BIJELJINA" joint-stock company,**  
**Velika Obarska - in bankruptcy**

Bijeljina, 19.03.2018.

Pre-investment study of "SUGAR FACTORY BIJELJINA" joint-stock company

## **Pre-investment study of "SUGAR FACTORY BIJELJINA" joint-stock company**

This pre-investment study was made on the basis of the Decision of the Board of Creditors held on the 8<sup>th</sup> of February, at "Sugar Factory Bijeljina" joint-stock company, which is in a bankruptcy, with the aim of offering a notion to potential strategic partners (buyers) about the possible revitalization of the factory, the possibilities of its future work and profitability of sugar production. According to the Decision, the leading designers are HAVREX ltd Banja Luka, Mr. Rade Rakic BSc Technology, Mr. Slobodan Rakic, B.Sc. El.Engineering and Mr. Fafulic Meho BSc Technology.

The pre-investment study has been done in the period February-March 2018, by the expert team, consisting of:

- Pavlovic Zoran, BSc Economics, HAVREX doo, - Team Leader, Banja Luka
- Zeljko Bogdanic, BSc Economics, HAVREX doo, Banja Luka
- Rakic Rade, BSc Technical Engineering
- Fafulic Mirko, BSc Technical Engineering
- Rakic Slobodan, BSc Technical Engineering
- Nikolic Vojislav, BSc Electrical Engineering
- Faik Muhic, BSc Law

Note:

Part of the team, who made the technical part of the Pre-Investment Study, namely Rakic Rade, Fafulic Mirko, Rakic Slobodan and Nikolic Vojislav, has full authority and credibility, because they worked as managers in the factory before the war, as well as managers who carried out the overhaul and preparation of the Sugar Factory plant A.D. Bijeljina for the performed production in the 2010 campaign, in which they managed to get the final product - sugar.

By performing the works, they simultaneously recorded and registered all the shortcomings for the Sugar Factory's full readiness, so it would be ready to work with 100% of the projected capacity. That's why they were tasked with making technical part of this Study, so that all potential partners can get acquainted with the necessary technical and commercial conditions to be met in order to restore production in Sugar Factory A.D. Bijeljina.

Pre-investment study of "SUGAR FACTORY BIJELJINA" joint-stock company

## **1. Brief history of "Sugar factory Bijeljina" joint-stock company**

Sugar factory Bijeljina was built and put into operation in 1979, based on the concept of the company "Polmex-checop" from Poland. The projected capacity of the factory is 4000 t /day of sugar beet processing. During the first years of production, factory could not achieve the projected capacity, so partial removal of bottlenecks started.

Reconstruction has been completed in 1990. Work in full projected capacity happened for the first time during the Campaign in 1991. After a successful campaign, the war started on the territory of Bosnia and Herzegovina, but even during the war in 1992, a campaign was successfully completed.

From 1993, until 2007 the factory did not work, but all the plants have been preserved and protected. The factory stopped working and got closed without debts to suppliers and creditors. In the meantime, workers (who were not dismissed) took over the obligation of protecting the factory without payment of wages.

During bankruptcy proceedings in 2009, the factory has been restarted by the owner, company "Agrokop" Export-import doo Banja Luka, with the aim of restoring production.

Strategic partner hired key managers and workers of the sugar factory to restart the production, as well as specialized construction, machine and electrical companies for the repair of equipment and facilities. The planned goal of the strategic partner was to start the plant in order to produce sugar and other by-products.

Factory started working in 2010 with available funds invested in repairs. During the trial production campaign, a smaller quantity of sugar beet has been processed (around 20,000 tons) and sugar was obtained. In this way, the goal of the strategic partner has been achieved.

In order to start the factory in full capacity, in January 2011, factory's expert team has begun to develop plans for capital overhaul:

- plans for reconstruction and first degree of modernization in the field of electric power plants
- automation of the technological process.
- installation of new filtration equipment and pumps for the transport of juices and sugar beet pulp,
- modernization of the processing laboratory and reception laboratory and
- procurement of the necessary mechanization in the internal transport department.

All expert analyzes have shown that the above-mentioned capital overhaul activities can be achieved with an investment of about 20.060.336 KM (Chapter 7: Recapitalization of total investment).

The factory's capacities are in solid condition, with preserved production unit and plants, with available human resources - key expert team, previous managers, and with sufficient number of

workers and available agricultural land in the range of 100 kilometers around the factory itself, sufficient to start production in the short term.

### **1.1.General characteristics of the factory**

Sugar factory - Bijeljina was built in 1979. The projected processing capacity is 4,000 tons of sugar beet per day. The planned annual processing during the production campaign is 400,000 tons of sweet root. Factory has been reconstructed in 1990 and 1991, and it has produced about 55,000 tons of sugar in the production campaign, which is maximum capacity achieved.

The factory covers about 50 hectares, which are owned by the factory. Ecological treatment of used water is done in lagoons, precursors. On an area of approx. 30 hectares, an administrative building was built, the main production hall with all accompanying facilities and belonging warehouses as well as dump sites for raw materials.

Factory is completely supplied with fresh water from its own wells - 3 wells of 300m<sup>3</sup> each. On the remaining 20 hectares, lagoons were built for the reception of all wastewaters with a purification system, so that it meets ecological criteria.

It owns its own 96 MW power plant which has

- two boilers of 50 tons working on coal from the local mine,
- two boilers of 4.5 tons working on oil,
- turbine and generator of 8 MW.

Electricity from electrical grid will be used only until the factory starts its own production, and after that, surplus of electricity produced will be possible to sell to the grid, on the basis of a contract with the Electro-distribution company.

With projected capacity of 4,000 t /day, sugar beet processing produces:

- app. 550 to 560 tons/day of sugar,
- 250 t/day of briquettes-dry noodles and
- 170 t/day molasses.

For the storage of produced sugar, there are two concrete silo with the total capacity of 40,000 tons. Packaging of sugar is carried out in a factory, equipped with:

- two semi-automatic machines for packing sugar in 50kg valve-bags, and
- Heeser type automatic machine for packaging one and two kilograms of sugar.

It also owns a line for the production of sugar in the shape of cubes, which is a traditional product in Bosnia and Herzegovina. Capacity of the production line for sugar in cubes is 23 t/day. Area for storing received sugar is approx. 2,000 m<sup>2</sup> with storage capacity of 8,000 t of packaged product in warehouses.

The molasses warehouse has a capacity of 14,000 tons. The storage room for the briquetted noodle has a surface of 3000 m<sup>2</sup>, with a processing capacity of 20,000 t of packed briquettes. In

its circle there is a petrol pump and warehouse for lubricants and other chemicals. It also has a spare parts storage with a useful area of approximately 500 m<sup>2</sup>.

Reception landfills and warehouses in the factory have:

- for a fresh beet, capacity of approximately 15,000 tons,
- coal ..... 20,000 tons,
- stone limestone ..... 10,000 tons
- petcock ..... 2,000 tons
- Mazut storage ..... 3,500 tons

The main administrative building has an office space of 400 m<sup>2</sup>, a restaurant of 500 m<sup>2</sup> and an ambulance of 40 m<sup>2</sup>. All the above facilities must be renovated.

The factory also has supporting facilities:

- Machine workshop with equipment for maintenance and production of spare parts for complete maintenance of mechanical and technological equipment,
- electro workshop and
- a mechanical workshop for the maintenance of its own construction and agricultural machinery.

The factory's own laboratory with its workers is able to control all input raw materials and chemicals as well as all stages of production in the technological process and finished products.

Sugar factory, in addition to the processing of sugar beets, can also perform

- refining of raw cane sugar (smaller reconstruction needed, for which there are projects) in the capacity of approximately 450 t / day of white crystalline sugar outside the campaign period.

For its production, the factory has until 1992. employed about 450 workers, and in the sugar beet season another 500 seasonal workers.

On the basis of production experiences, during the campaign of full capacity, the plant processes: 400,000 t of sugar beet and produces:

- 55 to 56,000 tons of sugar
- 17,000 tons of molasses
- 25,000 tons of briquetted noodles

and for this it spends:

- 40,000 tons of coal,
- 20,000t stone limestone,
- 2,000 tons of petcoke,
- 1,200,000 natron bags of 50 kg.
- 40t of lubricants,
- About 10,000t of mazut.

During the campaign, the factory hires more than 200 hauliers with their trucks, which are available locally for a period of 100 days of work, the same period as the duration of the sugar beet campaign.

Sugar factory has additional products during the production - molasses and noodles - which are easily marketable.

To statistical data, Bosnia and Herzegovina annually consumes around 150,000 tons of sugar. It must be emphasized in particular that the sugar produced in the sugar factory is a domestic product, produced from sugar beet grown on the fields of Semberija and Posavina.

In B&H, after the war, a refinery for the finishing production of raw sugar cane was erected in Brcko.

An analysis of the needs of the market in the environment of 400-800 km from Bijeljina showed that about 1.5 million tons of sugar is missing (Hungary, Romania, Italy, Bulgaria, Macedonia, Montenegro, Slovenia .....,).

Currently, the price of sugar on the European market ranges between 450 and 550 euros per tonne, which is a very good reason for any serious investor, to pay the creditors and take over the factory and start production.

## **2. Presentation of the current financial situation of the "Sugar Factory Bijeljina"**

As the Factory is in the bankruptcy process, a potential strategic partner / buyer can become a majority owner (67.98%) by paying off the claims of bankruptcy creditors totaling 16,262 thousand KM.

OWNERSHIP STRUCTURE (before proclaiming bankruptcy)

	Owners	Ammount in KM	% of ownership
1.	Shareholders' fund RS Banja Luka	14.690.121,45	61,41

Note: More details can be found in the financial statements shown on the Banja Luka Stock Exchange website, since Sugar Factory as a joint-stock company is obliged to publish them in this way, and all asset transactions take place through the Stock Exchange (link:

<https://www.blberza.com/Pages/issuerannouncements.aspx?&code=FSBN-R-A> )

Pre-investment study of "SUGAR FACTORY BIJELJINA" joint-stock company

### **3. Estimation of the market position**

#### **3.1. Data on sugar production and consumption in the world, Europe and Bosnia and Herzegovina**

According to the World Food Organization (WFO), which operates within the UN, the largest sugar producers

in the world and in Europe are:

\* The 10 largest sugar producers in the world

	Country	Production – millions of tonnes
1	Brazil	24,8
2	India	22,1
3	China	11,1
4	USA	8,0
5	Thailand	7,3
6	Australia	5,4
7	Mexico	4,9
8	France	4,4
9	Germany	4,2
10	Pakistan	4

The largest sugar producers in Europe

	Country	Production – millions of tonnes
1	France	4,4
2	Germany	4,2
3	Poland	2,0
4	Great Britain	1,2
5	Spain	1,2
6	Denmark	0,9

Total sugar production in the world is about 175 million tons, of which about 80% of sugar is produced from sugar cane, and 20% from sugar beet.

The average consumption of sugar in the world is 21.4 kg per capita. In developed countries the average annual consumption is 35-40 kg of sugar per capita, while in underdeveloped countries consumption of sugar is reduced to 5-10 kg per capita. There is growing consumption of various sweeteners around the world today, among which sugar is represented by 80%.

Based on detailed market situation analysis, the WFO estimates that by 2020, production of sugar will rise by 30 million tons, from the current 175 million. These estimates are made on the basis of population growth trend, the growth of economies and the industry of the most

populated countries. According to statistics, about 10% of the world's sugar is produced in Europe.

According to known facts, it is very likely that EU producers will increase production and sales to the world market, because Brazil is limited by resources and there is no possibility to increase production, while India, which is the second largest producer in the world, has a rather obsolete technology and ramshackled factories.

WFO forecasts that world production will increase to about 257 million tons in 2030, and 300-350 million tons of sugar by 2050.

In the near environment, sugar production is as follows:

### **3.2.Production of sugar in the environment**

	COUNTRY	Production in millions of tons	Notes
1	Serbia	0.55	<b>Active factories:</b> Pećinci, Kovačica, Vrbas, Senta, Žabalj, Crvenka <b>Closed factories:</b> Belgrade, Kovin, Požarevac, Čuprija, Peć, Bač, Zrenjanin, Šabac, Nova Crnja, Sremska Mitrovica
2	Croatia	0.35	<b>Active factories:</b> Virovitica, Osjek, Županja <b>Closed factories:</b> Beli Manastir
3	Bosnia & Herzegovina	0.13	<b>Active factories:</b> Breko (imports raw cane sugar and performs finishing-refining) Bijeljina is potentially in working condition, but does not work and is the only producing sugar factory in Bosnia and Herzegovina
4	Slovenia	-	<b>Closed factory:</b> Ormož
5	Macedonia	-	<b>Closed factory:</b> Bitola
6	Montenegro	-	No production of sugar

After the war, a refinery was launched for the finishing processing stages of raw cane sugar in Brčko and production in Bijeljina Sugar Factory started in 2010.

Based on the data of institutions that monitor the sugar market in the world and Europe, for the past three years there was a trend of sugar price increase, and with small variations in the price of sugar on world markets, it reaches a level of \$330 per ton, while on the European market it keeps the level between 450 and 550 euros per ton.

By analyzing the market, on the territory of Bosnia and Herzegovina, the placement of finished products should be guaranteed in full, as production with the full capacity of the factory (up to 60,000 tons of sugar) represents approximately 30% of the total needs of Bosnia and Herzegovina.

According to statistics, B&H uses about 160.000 tons of sugar annually. It has to be emphasized in particular that the produced sugar in Sugar Factory Bijeljina would be a domestic product made from sugar beet produced on the fields of Semberija and Posavina.

Molasses can also be fully marketed on the B&H market, and at competitive prices (which exceed production costs) can be fully exported to the surrounding countries. Ensiled or dried unsweetened noodles can be fully exported or fully placed on the domestic market.

### **3.3. Placement of finished products from production**

Production of sugar beet

The Semberija area has more than 38.000ha of arable land that is suitable for production of sugar beet, and we can safely expect sowing on surface of min. 4.000ha in Semberija.

With good organization and good business relationship with beet producers and good and quality work on the terrain, it is possible to perform quality sowing on the following areas in around 100 kilometers:

1. 3.000-6.000 ha in the area of Semberija
2. 1.000-2.000 ha in the area of Posavina
3. 2.000 ha in the area of Macva and Srem, which is sufficient for the planned capacity of the factory.

The factory has so far had the following range of finished products:

- crystal white sugar packed in 1, 2 and 50 kg
- dried and briquetted noodle packed in 40 kg
- molasses (delivery with auto-tanks)

Considering the fact that the previous offer of the basic finished product was very modest, in order to increase competitive ability in the market, there is the need for the extension to small and decorative packagings:

- on retail packages of 5-10 and 25 kg of sugar,
- so-called "Jumbo sacks" of 1.000 kg,
- horeca packages of 5-10 grams.

Let's also mention that there is a market place for liquid sugars, so during the reconstruction the line for the production of liquid sugars should be made functional.

The sugar factory during production has by-products, molasses and noodles, which are highly appreciated in the world as a raw material from which products are made, they reach multiple selling price in the market relative to cost price.

### **3.4. Use of by-products and refining of sugar cane**

The additional activity of the factory in the periods between the two campaigns is the possibility of sugar production from raw cane sugar. Investment is required for the stated. Securing the required quantities of raw cane sugar as an alternative raw material in the part of production is not a problem with regard to quantities available on the market (import) and the existing purchase price.

Possibilities for increasing the factory's income would be in the production of alcohol. Additional investment in equipment that would be installed in an existing hall for processing molasses into alcohol and livestock yeast would provide significant revenues.

Calculation shows that from 1 ton of molasses you get 500-550 liters of 96% alcohol which is an interesting product on the market. The current price of alcohol on the B&H market is about 2.50 KM/L.

Sugar factory as an additional by-product has unsweetened noodles that can always be sold like forage (animal feed). We suggest that the unsweetened noodle is dried, if the price of energy (eg fuel oil) is acceptable. Alternatively, if the price of the fuel is unfavorable, silage of the noodles can be done within the factory.

Silage would be marketed as animal feed in the Semberija area. The factory has the ability to produce very high quality silage, with very low production costs.

Third by-product is a very interesting saturated sludge, which would be adjusted, in order to obtain saturated fertilizer, which is very useful for soil calcification on the territory of Semberija and Posavina where the land is predominantly acidic. Saturated fertilizer is extremely useful to add to arable land, orchards, gardens.

Saturated fertilizer increases yield on acidic soils up to 40%, depending on the cultivated culture.

The factory is able to produce up to 30,000 tons of saturated fertilizer. Please note that the saturated fertilizer increases the biological and physical properties of the soil. It also accelerates the drying of the land after the big rainfalls, and controls moisture in the dry season.

The income from saturated fertilizers could reach up to 4,000,000 KM. In the area of Semberija, on more than 70% of the land 3-4 tons/Ha should be thrown per year. From this it can be concluded that in the next 10 years, market would be guaranteed.

Saturated fertilizer could be especially used as an additional stimulant to sugar beet producers, which would be detailed in the conditions of takeover, during contracting.

With the introduction of new products and the expansion of the range of production, the factory would be perform processing for approximately 300 day (in the form of extended campaign), the engaged labor force would be equally used throughout the year, and the factory would, on the

basis of this, realize added gross income at the annual level of about 30.000.000 KM (according to framework budgets).

The general conclusion is that for the complete production of the factory, there is enough market space, that is, the placement of goods is fully secured on the market of BiH and Europe.

#### **4. Technical-technological condition and necessary investments in phases and production lines**

##### **4.1. Capital overhaul, reconstruction, rehabilitation of facilities and procurement**

This Pre-investment study includes a list of necessary works on

- production equipment, works
- on the rehabilitation of the pipe network,
- construction works on buildings,
- modernization of production,
- renovation of the restaurant,
- purchase of new and used equipment for production,
- procurement of new equipment for the laboratory,
- procurement of used machinery for the purpose of serving the production,
- partial anticorrosion protection,
- procurement of office furniture and office equipment.

The repair can be performed by the workers of the Production and Technical Sector, who were previously employed in the factory, with engagement of third parties on specific tasks of Electric Power Engineering, Measurement Regulatory Techniques, Automation, Thermo-energetics and construction works (roof repair, facades, carpentry, etc.).

For the production realized in the 2010 campaign, activities on interventional rehabilitation were carried out on production facilities with the aim of starting production. During these activities that were realized in the factory, the following has been examined:

- state of the technological process
- state of electro-energy facilities
- the state of measurement-regulation techniques (which must be innovated)
- the state of automation (which must be innovated and/or completely replaced)
- state of thermos-energetics
- the construction condition of the facilities of the factory necessary for capital overhaul, which is designed and an integral part of the Study.

On the basis of realized production, capital overhaul must be done on the following technological units:

###### **I. Line for reception and storage of sugar beets**

2. Line for washing and transport of beets
3. Line for cutting and production of raw juice
4. Line for drying and briquetting of noodles
5. Line for cleaning and production of rare juice
6. The line for production of thick juice
7. Refinery
8. Production of lime, Ca(OH)2 and CO2-gas.
9. Energy facility and chemical preparation of water
10. Water supply and wastewater treatment system
11. Reception and processing laboratory
12. Electro-energy and Measuring-regulation technique
13. Storage line, sugar packaging
14. Work unit for transport and mechanization
15. Restaurant for workers

#### **4.2.Reconstruction, purchase of new and used equipment, construction rehabilitation**

The plan envisages the replacement of devastated and non-functional equipment in production by purchasing a new or adequately used equipment, which will technically be fully operational.

The following equipment must be restored to start production:

1. Purchase of 6 new centrifugal pumps for the transport of raw and light juice,
2. Purchase two new automatic presses instead of vacuum filters,
3. Purchasing of one new DDS filter-thickener on I-filtration
4. Procurement of 6 gear pumps for refinery
5. Purchase of one new or used electric pump for a power plant
6. Reconstruction on the vacuum line
7. Reconstruction of MRT and Automatics (project made in 2011)
8. Reconstruction - adjustment for the processing of sugar cane (project made in 1997)
9. Reconstruction of the PP network,
10. Procurement of new laboratory equipment
11. Purchase of new and used agricultural and construction machinery, as well as transport fleet
12. Procurement of restaurant equipments with a capacity of 400 meals
13. Procurement of office furniture
14. Procurement of biotechnical equipment
15. Repair of roofs - facade on buildings
16. Rehabilitation of the pipeline underground network

Through this process of preparation and trial production at the factory, records were made about the needs in all segments of the production process, and the drafting of framework base and calculations for capital overhaul whose complete information is given below.

#### **4.3 Projected investments**

Funds for Capital overhaul, reconstruction, modernization, construction works, procurement of equipment are estimated in this Study in the following way:

##### **RECAPITULATION OF COSTS**

1. LINE FOR RECEIPT, STORAGE, TRANSPORTATION AND WASHING OF BEETS .....	86,900 KM
2. CUTTING, EXTRACTION, DRYING AND BRIQUETTING OF NOODLES .....	.158,900 KM
3. LINE FOR THE PRODUCTION OF LIME AND CO <sub>2</sub> GASES .....	98,800 KM
4. CLEANING AND FILTRATION LINES .....	2,351,600 KM
5. LINE FOR EVAPORATION AND PRODUCTION OF THICK JUICES .....	67,000 KM
6. REFINERY .....	142,000 KM
7. LINE FOR DRYING, STORAGE AND PACKAGING OF SUGAR .....	85,900 KM
8. WATER SUPPLY AND WASTE WATER TREATMENT SYSTEM .....	1,286,000 KM
9. LINE FOR DRYING AND BRIQUETTING OF NOODLES .....	5,000 KM
10. ACCOMMODATION AND PROCESS LABORATORY .....	350,000 KM
11. ENERGY FACILITY.....	1,500,000 KM
12. REPAIR OF EL-ENERGETICS, MECHANOREGULATION TECHNIQUES & AUTOMATICS .....	6,000,000 KM
13. RECONSTRUCTION OF THE FACTORY FOR THE PROCESSING OF RAW CANE SUGAR .....	400,000 KM
14. PROCUREMENT OF THE TOOLS FOR THE TECHNICAL SECTOR .....	.. 80,000 KM
15. ANTICORROZIONAL PROTECTION .....	700,000 KM
16. FIXING UP THE FACTORY YARD AND REPAIR OF THE FENCE .....	.60,000 KM
17. RECONSTRUCTION OF FAÇADES AND ROOFS .....	800,000 KM
18. PURCHASE OF MECHANIZATION .....	850,000 KM
19. REPAIR OF THE RESTAURANT .....	80,000 KM
20. REPAIR OF THE ADMINISTRATIVE BUILDING OFFICE .....	60,000 KM
<b>TOTAL:</b>	<b>15,162,100 KM</b>

#### **4.4 Dynamic plan of estimated required investments for capital overhaul**

Date	Amount in KM	Planned works
<b>Phase I</b> T+ 7 days	2,000,000	<input type="checkbox"/> Development of detailed plans, projects, tenders <input type="checkbox"/> Restoration of the restaurant and equipment procurement <input type="checkbox"/> Purchasing tools <input type="checkbox"/> Procurement of mechanization <input type="checkbox"/> Procurement of spendable materials <input type="checkbox"/> Procurement of office furniture <input type="checkbox"/> The beginning of the repair of the machine-technological equipment <input type="checkbox"/> Introduction of third-party repair companies <input type="checkbox"/> Opening of the site <input type="checkbox"/> Procurement of el. cables and installation <input type="checkbox"/> Start <input type="checkbox"/> Commencement of energy overhaul and MRT <input type="checkbox"/> Procurement of spare parts by priority <input type="checkbox"/> The beginning of the renovation of roofs and facades <input type="checkbox"/> The beginning of works on the rehabilitation of the pipe network <input type="checkbox"/> Concrete rehabilitation of the pool and protection <input type="checkbox"/> Start of works on AKZ
<b>Phase II</b> T+ 15 days	1,000,000	
<b>Phase III</b> T+ 30 days	3,000,000	

		<ul style="list-style-type: none"> <li><input type="checkbox"/> Begin cleaning of the sedimentary deposits</li> <li><input type="checkbox"/> Payment of advances and invoices for executed procurement and works</li> </ul>
<b>Phase IV</b> T+ 45 days	4,000.000	<ul style="list-style-type: none"> <li><input type="checkbox"/> Orders of equipment whose delivery time is long, and by adopted procurement plan</li> <li><input type="checkbox"/> Payment of realized situations</li> </ul>
<b>Phase V</b> T+ 60 days	4,000.000	<ul style="list-style-type: none"> <li><input type="checkbox"/> Continuation of capital overhaul financing</li> <li><input type="checkbox"/> ...</li> </ul>
<b>Phase VI</b> T+7 months	1,162.100	<ul style="list-style-type: none"> <li><input type="checkbox"/> Final payment of capital overhaul</li> <li><input type="checkbox"/> ...</li> </ul>

**\*NOTE:**

1. In order to do a quality capital repair according to the above plan, the buyer / investor must provide 15.162.100KM, according to the proposed schedule.
2. In order to prepare the plant well for the processing of sugar beet in 2019, it is necessary to do the following:
  - That the investor forms management structure in the factory immediately after the factory has been taken over.
  - Employ the first group of workers no later than 15.08.2018., whose task would be to provide conditions for the opening of the construction site (prepare the plans and technical documentation, capacitate handy workshops, provide security equipment, provide manual and special tools, procurement of machinery, forming workers' restaurant, fixing up factory yard, forming factory security, draft normative acts for necessary legal-economic operations, etc.)
  - To adopt plans for overhaul and term plans for labor recruitment no later than 25.08.2018., as well as term plan for the introduction of specialized firms to overhaul.

\*\*NOTE: An electronic version of all the data required for the Factory overhaul is available to potential customers.

## 5. Human resources

### 5.1 Management of Sugar Factory Bijeljina a.d.

Key long-term managers of the sugar factory are still available for engagement and cooperation today and for start of production at the factory. The following former managers are available to this team today:

1. Rakić Rade, BSc.tech. engineer - technical and commercial manager
2. Fafulje Mirko, BSc tech.engineer. - technical and commercial manager
3. Rakić Slobodan, B.Sc., Process Manager, Zrenjanin
4. Nikolić Vojislav, BSc tech.engineer - company Energo System, Brčko - electro sector
5. Faik Muhić, lawyer - owner of the law firm Muhić, Tuzla - legal sector
6. Havrex Ltd. consulting company as supporting implementation company.

The above-mentioned team of experts made this Pre-Investment Study and biographies of all the above-mentioned managers are available to potential buyers.

### 5.2 Manpower

When the factory was in operation and production phases, before the war, it employed 450 permanent workers and about 500 seasonal workers.

In the case of planned modernization of parts of the factory, it is planned to have 200 permanent employees and 200 seasonal workers.

For newly-employed workers, a training program for the operations and use of installed equipment should be foreseen, and for that the above management team can be engaged.

## 6. The raw material base

### 6.1. Production of sugar beet in the Semberija area - history

The sugar factory has been operating since 1979 and has stopped working in 1993, due to the war in Bosnia and Herzegovina.

By re-launching the factory in 2010, the plant management, PD "Semberija", PZ "Agrosemberija", a number of cooperatives and individual producers began to work on reviving the production of sugar beet at these areas. Since the factory was stopped again, the activities on the expansion of production have stopped.

Semberija, which extends between two large rivers Sava and Drina, is an ideal area for the production of sugar beet, as water participates 75% in the yield. Water for the irrigation of arable land is located in sufficient quantity already at a depth of about 5 m.

Semberija has 38,000 ha of land that is suitable for the production of sugar beet, which enables production for the work of the factory with projected capacity with respect to the four-year crop rotation.

Semberija is affected by a moderate continental climate. The highest rainfall is in May and June, and the least in March and September. It is covered in snow up to 40 days (December-March). Winters are mild with average temp. of 2°C. Relative humidity is 70-80%. The number of sunny days varies from 75-100 days. Temperature in June, July, August and September ranges from 15-37°C. The average annual temperature is 10°C.

Semberija soil is of good quality, predominantly widespread is fertile black humus, wetland humus and river deposits. The larger arable land is suitable for growing sugar beets.

In the area of Semberija and Posavina sowing is done in the period from March 25 to April 20, on the prepared plots. Preparation of the sowing plot implies plowing, deep plowing, plating and spreading of fertilizers NPK 8-16-24 in the amount of 200 kg / ha. Before sowing, fertilization is carried out with NPK 15-15-15 at quantity of 400 kg / ha and KAN, AN in the amount of 200 kg / ha. The producers of used fertilizers are: Pančevo, Subotica (Serbia) and Kutina (Croatia).

If the autumn preparations are properly carried out and rough handling of the plot, pre-sow processing of the soil and quality protection from pests (cercosporas, CSFB, stem weevils,

aphids) the yield must be good. With quality preparation, yield in Semberia was about 45 to 55 T/ha.

Protective agents (insecticides, herbicides) were used from the maker BASF - Germany. In practice, these fertilizers are given as an advance. In the course of sowing, spraying agent against weeds is also given as an advance. Funds for other sprayings were given out for free, because domestic producers do not have enough funds, and in this way better cooperation has been achieved.

Mostly, the KWS seed of the new generation was used. Seeding with planned crop rotation every four years on the same plot has been carried out according to the planned production before 1993. The required amount of seed is around 1.2 SJ/ha. Sowing is done by pneumatic seed sowing machines.

## **6.2. Serving the cultivation of sugar beet**

Since in the territory of the Republic of Srpska households have smaller plots (on average 2ha), the number of growers, before the war, ranged from 3000 to 4500 with an average area of 0.8ha. Today, a substantial number of individual producers own plots of over 10ha.

Procurement contracting of sugar beets was done directly between factory and producers, very small amount through cooperatives.

The complete production of sugar beet was funded in advance by the factory with the free allocation of funds for spraying against pests. In order to improve the production of sugar beet, factory donated around 15% of the raw noodles to producers for the delivered beets.

Sugar factory relies only on road transport, which significantly increases production costs. It's necessary to continue activities on securing railway transport to the factory. There are no local factories which produce machinery for the production of sugar beet (sowing machines, combine harvesters and other agricultural machinery). Many of those factories were alienated or devastated in the war. The purchase of new mechanization is needed.

In order to ensure a good yield, and this will certainly be solved by irrigation, it is necessary to procure systems for irrigation. Currently in Semberija there is a small number of households that own equipment for irrigation. Currently, in the Republic of Srpska, the prices of other agricultural crops are not favorable for production in relation to sugar beet. Today, only vegetable production has an advantage over sugar beets. The advantage in the production of sugar beets in relation to vegetables is the secured purchase of complete production and guaranteed respect for the agreed price.

## **6.3. Quality control of sugar beet growing**

Determination of sugar beet quality is done in the factory laboratory. Sugar beet quality (sugar content and % of impurities) is determined in a raw material laboratory, by taking at least one sample from each vehicle.

**OPINION:**

The future investor/owner has a good perspective to provide enough sugar beet in the area of Semberija and Posavina, in order to cover full capacity of the factory.

Also, since sugar factories in Sabac and Sremska Mitrovica have been closed, this gives the chance to Bijeljina sugar factory to cover production and purchase of sugar beets from the indicated area. Macva region is especially interesting, because the distance from the Sugar Factory to the fields is 60 km.

**6.4. Sugar beet production plan for 2019 campaign.**

For the campaign in 2019, the production of approx. 300,000 tons of sugar beet can be planned at the area of Semberija and Posavina, Srem and Macva.

The Semberija area has more than 38,000 ha of arable land that is suitable for production of sugar beet, which is a basic requirement to safely expect sowing on a surface of min. 4.000 ha in Semberija alone.

With good organization, good business relationship with beet producers, good and quality work on the field, it is possible to perform quality sowing on the following areas:

	In 2019.	In 2020.
	Ha	Ha
Semberija	3000	4000-6000
Posavina	1000	1500-2000
Srem-Macva	2000	2000

In order to, with certainty, create an interest in planting this industrial culture by producers from Semberija and Posavina, the strategic partner / owner of the factory must be especially engaged in the field, and the support of the Government of Republika Srpska is also needed.

- With good organization, disciplined work in the field and quality incentive, the opinion is that it is possible to achieve sowing on cca 6000 Ha, which would enable one quality production in 2019.  
To achieve the planned quantities of sugar beets it is necessary to provide contracts by the end of September 2018., in which the obligations of the sugar factory and sugar beet producers will be clearly defined.
- Because of the importance of sugar beet production and factory operation, we suggest sugar beets should be treated by the Government as a strategic product, as this is a significant capacity that can contribute increase of the gross social product of the Republic of Srpska.

- In accordance with the calendar for the production of sugar beets, all the producers should be timely provided with raw materials, complete expert supervision from land preparation, sowing to extraction and handing over to the factory. It is also important to create trust between the farmers and the factory, agreed payment time for the delivered sugar beet should be respected.
- Recommendation:  
To request from the Government of the Republic of Srpska or the Ministry of Agriculture to include it in the incentives plan for the production of sugar beets, in order to stimulate agricultural producers for sowing in 2019. It is considered that the incentive must be related to kg of delivered beets, not to the land area seeded with beets. Our proposal to Republic of Srpska Government: Incentive should be 0,02 KM/kg of delivered clean beet to the factory in Bijeljina.

#### **6.5. Planning the purchase price of sugar beet**

For the production of sugar beet in 2019, in this pre-investment study, calculations were made according to the following conditions:

1. The purchase price of sugar beet would be 70 KM/t of pure beet, and on the basis of a digestion of 16%.

2. For greater or lesser digestion the price is calculated on the basis of the following table:

Digestion %	Up to 12,99	13,00	13,50	14,00	14,50	15,00	15,50	16,00	16,50	17,00	17,50	18,50
Price KM/t	54,69	56,88	58,80	61,25	63,43	65,62	67,81	70,00	72,19	74,38	78,56	78,75

3. Provide sugar beet seeds in advance (1.2 SJ/ha)
4. Provide an agent for protection against cercospora in advance
5. Provide an agent for protection against stem weevils in advance
6. Stimulation in the form of fertilizers/raw noodles of 10% on the delivered amount of pure beet.
7. Provide basic mineral fertilizer for NPK 15:15:15 in the amount of 600 kg/ha in advance
8. Provide mineral fertilizer KAN in the amount of 400 kg/ha in advance
9. It is necessary to ask the Government of RS to grant a subsidy to producers on diesel of 40l/ha
10. The Government of the Republic of Srpska should be asked to support the plant by encouraging producers of sugar beet

It is proposed that the final calculation be made within 5 days after the delivery of the sugar beet, and in accordance with the agreement. Payments according to calculation should be made within 30 days at the latest.

In order for the production plan to succeed, it is necessary to urgently approach the development of a plan for the procurement of the necessary raw materials, and start all the field activities. It is necessary to immediately, after the signing of the Contract with the farmer, deliver all materials (seeds, fertilizers, protection agents...)

Land preparation, sowing and supervision during production, extraction and transfer to the factory should be carried out by regional instructors and the factory's department responsible for the production of sugar beets.

**NOTE:**

- The expected-planned yield is at least 45 t/ha.
- In 2019, contracting sugar beet farmers from Macva and Srem region, should be planned, at an area of about 2,000 ha.
- Production of sugar beets should be planned in a diameter of up to 100 km from the factory.

## 7. Recapitulation of total investments for the start of production

	<b>Recapitulation of total investment</b>	<b>In KM</b>
1	Capital overhaul and modernization of plants	15,197,302
2	Other and unpredictable investments	1,823,670
3	Working capital	3,039,364
	<b>TOTAL</b>	<b>20,060,336</b>

On the basis of all of the previously mentioned elements of a pre-investment study, it can be considered that for start-up of production, estimated other and unforeseen investments, and working capital required to start work and organize sugar beet production with farmers, we estimate that it is necessary to provide an amount of **20,060,336KM**

## 8. Planned income from sale of the basic product - sugar and other products

### 8.1 Production plan

In the 2019 campaign, plan is to process at least 300,000 tons of sugar beet.

By processing 300,000t of sugar beet it is possible to produce:

1. Sugar from beet (13%) .....	39,000t
2. Molasses (4.5%) .....	13,500t
3. Dried Noodle (6.3%) .....	18,900t

### 8.2. Value of production

<b>Value of production (realization)</b>						
	2019	2020	2021	2022	prices	
1. Sugar from beet	35,100,000	46,051,200	49,982,400	49,982,400	900	KM/t
2. Sugar from cane	-	-	-	-	-	-
3. Molasses	4,050,000	5,313,600	5,767,200	5,767,200	300	KM/t
4. Dried noodle	6,615,000	8,678,880	9,419,760	9,419,760	350	KM/t
<b>TOTAL</b>	<b>45,765,000</b>	<b>60,043,680</b>	<b>65,169,360</b>	<b>65,169,360</b>		

Note: \* Prices are based on currently valid market prices in B&H.

Pre-investment study of "SUGAR FACTORY BIJELJINA" joint-stock company

## 9. Dynamic projections for the production of sugar beet and the provision of basic raw materials and reproductive materials

Sugar beet production plan	2019		2020		2021		2022	
	ha	t	ha	t	ha	t	ha	t
Semberija	3,250	156,000	5,000	240,000	5,700	273,600	5,700	273,600
Posavina	1,000	48,000	1,200	57,600	1,200	57,600	1,200	57,600
Srem-Macva	2,000	96,000	2,000	96,000	2,000	96,000	2,000	96,000
<b>TOTAL</b>	<b>6,250</b>	<b>300,000</b>	<b>8,200</b>	<b>393,600</b>	<b>8,900</b>	<b>427,200</b>	<b>8,900</b>	<b>427,200</b>

<b>TOTAL</b>	<b>300,000</b>	<b>393,600</b>	<b>427,200</b>							

## 10. Dynamic projection of sugar production to achieving full capacity

Plan of sugar production	2019		2020		2021		2022	
	t		t		t		t	
Sugar from sugar beet t	39,000		51,168		55,536		55,536	
Molasses t	13,500		17,712		19,224		19,224	
Dried noodles t	18,900		24,797		26,914		26,914	

## 11. Calculation of operating costs and other operating expenses

### 11.1. Material costs of raw materials and intermediate goods, labor and other operating expenses

- Projection of the expenditure of funds is based on planned norms for processing 300,000 tons of sugar beet, and current prices.

	Plan of operating expenses	2019 2020 2021 2022 ....				(prices)	normativ Per 1t of beet
		2019	2020	2021	2022 ....		
1	Sugar beet	21.000.000	27.552.000	29.904.000	29.904.000	70	
2	Coal	3.750.000	4.920.000	5.340.000	5.340.000	125	0,100
3	Stone	198.000	259.776	281.952	281.952	12	0,0550
4	Pet coke	792.000	1.039.104	1.127.808	1.127.808	600	0,0044
5	Fuel oil (**for drying of noodles)	5.953.500	7.810.992	8.477.784	8.477.784	900	0,02205

Pre-investment study of "SUGAR FACTORY BIJELJINA" joint-stock company

6	Firewood for furnaces and boilers	960	1.260	1.367	1.367	60	0.000053

### 13. Dynamic market-financial assessment of investments

In order to create a fair and realistic dynamic financial evaluation of this projected investment (observed as an investment), a hypothetical assumption is made that the investment in question will be financed with long-term commercial loan (which is usually the case with such investments), under conditions that are shown:

Loan			Amount in KM
Amount:	20.060.336	Annual interest in grace p.	1.203.620
Grace period:	1 year		
Repayment period:	10 years	annual annuity	2.949.315 KM
Annual interest rate:	6%		

Concerning the roadmap, investment in equipment constitutes majority of investment, hence we took in consideration equipments' presumed lifetime and functional usage. The deadline for repaying a potential loan for financing of such investment, is in accordance with the aforementioned, and it all together defines the economic life of the project (investment) and all dynamic projections have been done in accordance.

ROADMAP (Economic life of the project): 10 years

	Financial flow (in 000 of KM)	2019	2020	2021	2022	2023	2025	2026	2027	2028
1	Total income	45.810	60.089	65.214	65.214	65.214	65.214	65.214	65.214	65.214
2	Financial sources	20.060	0	0	0	0	0	0	0	0
3	The rest of the project value	-	-	-	-	-	-	-	-	25.614
4	<b>Inflows</b>	<b>65.870</b>	<b>60.089</b>	<b>65.214</b>	<b>65.214</b>	<b>65.214</b>	<b>65.214</b>	<b>65.214</b>	<b>65.214</b>	<b>90.828</b>
5	Investments	20.060	0	0	0	-	-	-	-	-
6	Material costs	32.878	42.975	46.600	46.600	46.600	46.600	46.600	46.600	46.600

The financial evaluation of the investment primarily involves the assessment of liquidity. Liquidity of this kind of project implies its ability to settle all mature financial obligation at any time. Net inflows in the financial flow represent an increase in the financial potential (provided they are of positive size).

The liquidity of this project is estimated to be very favorable, since the net inflows in all years of the project's lifetime are positive or in other words the financial evaluation of such a project is "a very liquid project".

	Financial flow (in 000 of KM)									
		2019	2020	2021	2022	2023	2025	2026	2027	2028
1	Total income	45.810	60.089	65.214	65.214	65.214	65.214	65.214	65.214	65.214
2	The rest of the project value	-	-	-	-	-	-	-	-	25.614

4	Investments	20.060	0	0	0	-	-	-	-	-
5	Material costs	32.878	42.975	46.600	46.600	46.600	46.600	46.600	46.600	46.600
6	Costs of salaries and other pers. expenses	5.151	5.151	5.151	5.151	5.151	5.151	5.151	5.151	5.151
7	Other expenses	1.150	1.400	1.489	1.489	1.489	1.489	1.489	1.489	1.489
8	Liabilities for profit tax	382	1.190	1.331	1.331	742	742	742	742	742
9	<b>Outflows</b>	<b>59.621</b>	<b>50.716</b>	<b>54.571</b>	<b>54.571</b>	<b>53.981</b>	<b>53.981</b>	<b>53.981</b>	<b>53.981</b>	<b>53.981</b>
10	<b>NET Inflows</b> (3-9)	<b>- 13.811</b>	<b>9.373</b>	<b>10.643</b>	<b>10.643</b>	<b>11.233</b>	<b>11.233</b>	<b>11.233</b>	<b>11.233</b>	<b>36.847</b>

The economic flow of the project shows economic benefits and economic sacrifices in the lifetime of the project, no matter the way in which it is financed, and based on the economic flow, the profitability of the project is evaluated and by doing so, the direct contribution of the investment concerned is measured. Since the values of net inflows of economic flow are shown dynamically in the future, it is necessary for values of future net inflows to be reduced to value from the year when the investment is made, and mentioned reduction of the value is done through a discount rate. The discount rate is determined as an average weighted interest rate which we equalize with the price of the funding source or in this case discount rate is determined as the real positive interest rate for the commercial loan from which a complete investment could be financed, which on the domestic financial market on average amounts to:

Discount rate	6.00%
---------------	-------

According to the method of the period of return on investment, the total funds invested are fully recovered in the third year of the project life, ie in 2,3 years, which is logical given the high liquidity and the accumulation of the investment in question.

Investment return period (in 000KM)						
	Year of project's life	Total investment		Amount of accumulation		Uncovered part of the investment
		Annual	Cumulatively	Annual	Cumulatively	
2019	0	20.060	20.060	6.249	6.249	-13.811
2020	1	0	20.060	9.373	15.622	-4.438
2021	2	0	20.060	10.643	26.266	6.205

The Net Present Value (NPV) shows the net effect of the project being reduced to the present value. The values of net inflows from the economic flow are reduced to the present value using discounted rates of 6%. The net present value in the amount of 70.736.000KM is obtained by discounting. Since NPV is positive, this means that according to this criterion, the project is acceptable and feasible. It also means that this project is worth financing by a long-term loan with an interest rate equal to the discount rate (6%) with the exceptionally high profitability of thus conceived investment.

Net Present Value (NPV)									
in 000KM	2019	2020	2021	2022	2023	2025	2026	2027	2028
NET inflows from finance.flows	- 13.811	9.373	10.643	10.643	11.233	11.233	11.233	11.233	36.847
Discounted rate 6,00%									
Net Present Value (NPV)	<b>70.736</b>								

By applying the internal rate of return (IRR) method, the discount rate is determined, which is equaled with zero, by the present value of the net inflows of the economic flow of the project. The IRR of this project is remarkably high and amounts to 77.50% as a result of high liquidity and profitability of such a project.

The internal rate of profitability represents the maximum acceptable interest rate at which this project could be funded (if it is financed entirely from the loan).

IRR also represents the rate of return brought by the capital invested in such a project (or can be interpreted as the average annual blurring of the investment).

Since the IRR is far above the average interest rate on loans, by this criterion as well **this project is recommendable, acceptable and feasible.**

Internal rate of return (IRR)		
Discounted rate		Net Present Value in 000KM
	6%	72.224
	25%	22.011
	40%	9.461
	75%	292
	77%	71
	77,50%	18
	<b>77,67%</b>	0

## **14. Conclusion:**

- Sugar factory Bijeljina was built and put into operation in 1979, according to the concept of "Polmex checop" from Poland. The projected capacity of the factory is 4000 t/day of sugar beet processing. During campaigns in 1991 and 1992, the projected production capacity of 55,000 tons of sugar has been achieved. After the successful campaign, the war started on the territory of Bosnia and Herzegovina, but even during the war year - 1992, a campaign was successfully completed. From 1993 until 2007, the factory did not work, but all plants are preserved and protected. Trial production happened in the 2010 campaign.
- Due to the impossibility of settling tax liabilities, the Tax Administration of Republic of Srpska has launched the second bankruptcy over the Sugar Factory, on 16.12.2015, which is still in progress. During the bankruptcy procedure, the judge acknowledged claims from creditors, and **Sugar Factory Bijeljina today has the Bankruptcy Manager, the Assembly and the Creditors' Committee, but HAS NO OTHER LIABILITIES** and also has an active account in a commercial bank, but it still in the process of bankruptcy.
- Potential strategic partner, by purchasing all recognized claims from creditors in the amount of 16,261,961.53KM, ie by payment of a certain amount of claims to creditors of bankruptcy debtor, will become the 100% owner of the bankruptcy debtor - Sugar Factory Bijeljina, and in legal terms will become the "legal successor" of all rights of the sugar factory without any further additional obligations.
- In order to start the factory in full capacity, factory's expert team has developed plans for capital overhauls that are available and include:
  - plans for reconstruction in the field of electro
  - energy plants
  - automation of technological processes,
  - complete modernization of production management through computer systems
  - installation of new filtration equipment and pumps for the transport of juices and sugars,
  - modernization of the process and reception laboratory and
  - procurement of the necessary mechanization in the internal transportation department.
- All expert analyzes have shown that **for these capital overhaul tasks, an investment of around 20,060,336 KM must be planned**. The total invested funds will, according to the Study and method of return period of the investment, be **fully refunded in the third year of the project, i.e. in 2.3 years of production**.
- The liquidity of this project is estimated to be very favorable, as the net inflows in all years of the project life are positive or in other words a financial grade of such project is a "**highly liquid project**".

- Since **IRR** is far above the average interest rate on loans, by this criterion as well, this project is recommended, acceptable and feasible.
